Employer and employees must learn the requirements of Part I which contains Subpart R of OSHA 1910.269. They must implement such rules to provide safety when performing maintenance on high voltage electrical installations. Part II covers the grounding of lines and equipment to protect employees from injury should reenergization of the system occur. Proper grounding provides protection against induced voltages and static charges on a line. These induced and static voltages can be high enough to endanger workers either directly from electric shock or indirectly from involuntary reaction. Grounding is a temporary protective measure which involves connecting the deenergized lines and equipment to earth through conductors. As long as the conductors remain deenergized, this maintains the lines and equipment at the same potential as the ground earth. However, if voltage is impressed on a line, the voltage on the grounded line rises to a value dependent upon the impressed voltage, the impedance between its source and the grounding point, and the impedance of the grounding conductor, which provides a margin of protection for workers. The grounding of high voltage lines and equipment will provide additional safety for workers from electrical shock where such grounds are sized, selected, and installed properly.

Stallcup's OSHA Electrical Maintenance Regulations Simplified 2014 Grayboy, 2017-05-08. This book was developed to make OSHA rules easy to understand and enforce. The rules are taken from NFPA 70E Electrical Safety In The Workplace and correlated with OSHA 29 CFR 1910 Subpart S, OSHA 29 CFR 1926 Subpart K, ANSI C2 National Electrical Safety Code (NESC), and NFPA 70 National Electrical Code (NEC). Many designers, installers, and inspectors have trouble understanding, interpreting, and applying the electrical requirements listed in the above standards and codes. These requirements have been assembled and correlated in such a manner as to be easily understood. To help expedite the time involved in finding the rules and applying the requirements for general industry sections, in each standard, have been listed for fast reference. Designers must design and lay out electrical systems to meet the provisions of the OSHA standards. Installers are required to install and wire electrical systems to comply with the NEC and provide safety for the employee working in his or her workplace. Inspectors must inspect the electrical system to ensure that it not only complies with the NEC but also provides the necessary safety requirements of OSHA and NFPA 70E. The standard NFPA 70E was developed by NFPA at the request of OSHA. OSHA needed this standard to help them keep as current as possible with the requirements in the NEC that pertain to safety related work practices. The OSHA standards are rarely changed and therefore lag behind the NEC as well as other codes and standards. Throughout the book, you will find examples and illustrations as well as the highlighted text. Standards to review which interface OSHA, NFPA 70E, and the NEC where applicable.
