**Osteopontin** David T. Denhardt, 1995 Osteopontin is a GRGDS containing phosphoprotein secreted by most epithelial cells many cancer cells and stimulated or activated cells of various types including smooth muscle cells fibroblasts and macrophages It is a ligand for the  $\alpha$ v $\beta$ 3 integrin promoting cell adhesion and triggering a signal transduction pathway that can influence gene expression Binding multiple Ca ions osteopontin is involved in the formation and remodelling of mineralised tissues and Ca homeostasis it has also been implicated in host defence mechanisms *Metabolic Bone Disease and Clinically Related Disorders* Louis V. Avioli, Stephen M. Krane, 1997-10-08 Metabolic Bone Disease Third Edition is the new expanded edition of the classic text featuring the latest advancements and research information in this fast moving field The Third Edition includes the most up to date information on molecular mechanisms basic biology pathophysiology and diagnosis and management strategies of metabolic bone disease Edited by fathers of the field An expanded version of a classic AP text Complete coverage of a fast growing field Cancer Metastasis — Related Genes D.R. Welch, 2006-04-11 Being diagnosed with cancer is devastating But when the cancer cells have to spread to form secondary colonies the prognosis for the patient is worse If meaningful improvements in survival are to occur then control of metastasis will be a foundation Relatively little is known about the control of the metastatic process at the molecular level This volume begins to explore our current knowledge regarding the underlying molecular and biochemical mechanisms controlling the metastatic phenotype While all of the authors attempted to put their findings into a context for translation to the clinical situation the state of the art does not fully allow this Nonetheless we write these summaries of our work as an early effort toward that end I am grateful to all of the authors who have contributed generously of their time and energies to make this volume a reality To metastasize neoplastic cells dissociate from the primary tumor enter a circulatory compartment typically lymphatics or blood vasculature survive transport arrest exit the circulation and finally proliferate at a discontinuous site in response to local growth factors Unless cells accomplish every step of the metastatic cascade metastases cannot develop The process is highly inefficient i e **Cumulated Index Medicus** ,1994 **Journal of the National Cancer Institute** ,1994-10 The Role of Naturally Occurring Biomolecules in the Crystallization of Calcium Oxalate Monohydrate Matthew Lenn Weaver, 2008
