Recent Advances in Marine Science and Technology, 98 Narendra Saxena, 1999 **Asia-Pacific Coasts and Their Management** Nobuo Mimura, 2008-01-14 The Asia and Pacific region is home to the world's largest concentration of coral reefs and mangroves. It accommodates two thirds of the world's human population and its economic activities have the highest growth rate in the world. This book gives an overview of the state of the art understanding on the drivers, state and responses to the coastal environmental changes in the Asia and Pacific region. It provides important perspectives on the subject for researchers.

Handbook of Marine Mineral Deposits David Spencer Cronan, 2017-10-19 This handbook summarizes the main advances in our understanding of marine minerals and concentrates on the deposits of proven economic potential. In cases where our knowledge may be too limited to allow defining of their economic potential, those minerals are covered regionally or by deposit type. *Handbook of Marine Mineral Deposits* is divided into three sections: Marine placers, manganese nodules and crusts, and deep sea hydrothermal mineralization. All of these mineral deposits have great potential importance to economic geologists and marine mines. Edited by an acknowledged expert in the field, this handbook includes work by internationally renowned contributors. The new United Nations Law of the Sea, ratified by over 100 countries within the past two years, provides a framework and guidelines for deep sea mineral exploration that increases international interest in this book. The Handbook serves as a platform from which to launch the more detailed evaluation studies that will need to take place in the 21st century before recovery can continue or commence. *Handbook of Marine Mineral Deposits* is useful to mineralogists, economic geologists, marine geologists, marine miners, and conservationists.

Fluid Mechanics for Marine Ecologists Stanislaw R. Massel, 2012-12-06 The future quality of life on Earth fundamentally depends on trends in world climate. The oceans play a dominant role in regulating global climate by helping to control greenhouse gases, global heat transfer, and weather patterns. If we also consider the energy and other resources oceans offer, their essential importance to human existence becomes obvious. Ocean waters are in endless motions. Scales of these motions vary from micro-turbulence through to surface and internal waves, tides, and global currents of planetary dimensions. However, in each case, the water motion satisfies the fundamental fluid mechanics and geophysical fluid mechanics principles. Oceans are not empty but support a large variety of organisms and plants. Many of the basic attributes of life of these creatures raise such questions as: why are the ocean's living resources distributed as they are? how can cyclical changes overthrow the system? why do organisms have a particular size and shape? how do they move and reproduce? how do they capture food and many others. In the majority of situations, biological processes appear to be strongly influenced by the physics, while the physical processes are largely independent of the biology. However, when we consider a time scale of thousands of years, the feedback from biology to physics is not so simple. The present composition of the Earth's atmosphere and the present average temperature at the surface of the Earth have been strongly influenced by living organisms. *Risk*
