CO₂-microemulsions with additives Yvonne Pütz, 2015-07-20 Improved building insulation is an important part of today's efforts on energy saving Here nano insulation materials promise especially low thermal conductivity Therefore an easy and cost efficient production of these materials is an aim of present material research One approach towards these materials is the expansion and fixation of polymerisable microemulsions of supercritical blowing agents However the nano sized bubbles are found to undergo undesired coarsening processes In order to reduce the increasing interfacial tension emerging during expansion and therewith the coarsening it was suggested to add low molecular hydrophobic substances to the supercritical microemulsion And indeed the addition of cyclohexane to a microemulsion of the type brine CO₂ fluorinated surfactants was found to reduce the fluorinated surfactant content a measure for the interfacial tension considerably In this work a systematic small angle neutron scattering SANS contrast variation was performed and the data were analysed by model independent Fourier analysis It was found that a concentration gradient of cyclohexane inside the CO₂ cyclohexane microemulsion droplets forms Interestingly the analysis reveals a depletion zone close to the amphiphilic film which presumably develops due to the known repulsive interactions of cyclohexane and the fluorinated surfactant tails Using a specially designed high pressure SANS cell to perform stroboscopic pressure jumps the influence of cyclohexane on pressure induced elongation of microemulsion droplets as well as the early state of foaming after expansion was studied Here the pressure dependent thermodynamic stability of such microemulsions allows for a fast repeatability of the pressure cycles It turned out that cyclohexane systematically slows down the structural changes in all processes Parallel pressure jump experiments with poly N isopropylacrylamide PNIPAM particles revealed that hydration and dehydration kinetics can be studied with the same experimental setup The first kinetic experiments which combine a CO₂ microemulsion mixed with PNIPAM particles indicate that PNIPAM acts as a stabiliser for the microemulsion and further reduces the thermodynamic driving force of the demixing process Aperiodic '94 - Proceedings Of The International Conference On Aperiodic Crystals Gervais Chapuis, W Paciorek, 1995-06-30 The conference promotes the theoretical and methodological development of crystallographic investigations of aperiodic crystals including modulated structures polytypes incommensurate misfit or composite crystals and quasi crystals It also promotes scientific interchange among groups working in the various fields of

aperiodic materials Special emphasis will be given to multidisciplinary aspects of aperiodicity *Modern Charge-Density Analysis* Carlo Gatti, Piero Macchi, 2012-01-09 Modern Charge Density Analysis focuses on state of the art methods and applications of electron density analysis It is a field traditionally associated with understanding chemical bonding and the electrostatic properties of matter Recently it has also been related to predictions of properties and responses of materials having an organic inorganic or hybrid nature as in modern materials and bio science and used for functional devices or biomaterials Modern Charge Density Analysis is inherently multidisciplinary and written for chemists physicists crystallographers material scientists and biochemists alike It serves as a useful tool for scientists already working in the field by providing them with a unified view of the multifaceted charge density world Additionally this volume facilitates the understanding of scientists and PhD students planning to enter the field by acquainting them with the most significant and promising developments in this arena
