Reefs of Time Lisa S. Gardiner, 2025-06-10 How fossilized reefs hold clues to the survival of corals in the Anthropocene With rising global temperatures pollution overfishing ocean acidification and other problems caused by humans there's no question that today's coral reefs are in trouble As predictions about the future of these ecosystems grow increasingly dire scientists are looking in an unlikely place for new ways to save corals the past The reefs of yesteryear faced challenges too from changing sea level to temperature shifts and understanding how they survived and when they faltered can help guide our efforts to help ensure a future for reefs Lisa Gardiner weaves together the latest cutting-edge science with stories of her expeditions to tropical locales to show how fossils and other reef remains offer tantalizing glimpses of how corals persisted through time and how this knowledge can guide our efforts to ensure a future for these remarkable organisms Gardiner takes readers on an excursion into the shallow end of deep time when marine life was much like today's yet unaffected by human influence to explore the cities of fossilized limestone left behind by corals and other reef life millennia ago The changes in reefs today are unlike anything ever seen before but the fossil record offers hope that the coral reefs of tomorrow can weather the environmental challenges that lie ahead A breathtaking journey of scientific discovery Reefs of Time reveals how lessons from the past can help us to chart a path forward for coral reefs struggling for survival in an age of climate crisis and mass extinction

Oceans James Fargo Balliett,2014-12-18 Covering 71 percent of the planet these saline bodies of water provided the unique conditions necessary for the building blocks of life to form billions of years ago This book explains how our oceans continue to support and influence life in important ways by providing the largest global source of protein in the form of fish

populations by creating and influencing weather systems and by absorbing waste streams such as airborne carbon. It is shown how oceans have an almost magnetic draw: almost half of the world's population lives within a few hours of an ocean. Although oceans are vast in size, exceeding 328 million cubic miles (1.37 billion cubic kilometers), they have been influenced by and have influenced humans in numerous ways. The book includes three detailed case studies. The first focuses on the most remote locations along the Mid Atlantic Ridge where new ocean floor is being formed twenty thousand feet underwater. The second considers the Maldives, a string of islands in the Indian Ocean where increasing sea levels may force residents to abandon some communities by 2020. The third describes the North Sea at the edge of the Arctic Ocean where fishing stocks have been dangerously depleted as a result of multiple nations' unrelenting removal of the smallest and largest species.

Protected Areas and International Environmental Law Alexander Gillespie, 2007-11-30. This volume seeks to provide the reader with a clear understanding of the way that protected areas are created, listed, and managed in international law. In doing so, it provides a complete overview of the primary international and regional conventions in this area and the decisions and resolutions that have come from them. In doing so, it provides a comprehensive examination of inter alia the World Heritage Convention, the Man and the Biosphere regime, the Ramsar Wetlands Treaty, and the Convention on Migratory Species. It also deals extensively with the important regional conventions in this area covering Europe, Africa, and the Americas. The regimes governing international maritime protected areas and Antarctica are also dealt with. In each area, the values, selection considerations, management, and compliance considerations are examined in detail and linked into recognizable examples from well-known protected sites of international significance.
