HUMAN FACTORS IN MARINE CASUALTIES

ABSTRACT

Human factors play an important role in the origin of accidents, and it is commonly claimed that between seventy and ninety-five percent of industrial and transport accidents involve human factors, see Figure 1.

Some authorities, however, claim that ultimately, all accidents involve human factors.

KEY WORDS

marine accident, human factor, organisational factor, attention, memory

1. INTRODUCTION

Before we can start to understand why accidents happen, we need first to understand a little about human limitations. An area of human factors, which has received a great deal of interest, is human cognitive abilities and limitations. This includes constructs such as attention, memory, decision-making, action, skilled performance, and stress. Greater understanding of this area enables us to reduce errors and accidents caused by technology. It also helps investigators understand how accidents happen and assists in determining suitable recommendations.

2. ATTENTION

Attention is such a fundamental fact of life that we may not even be aware of how our attention works and what the limits to attention are. For example, what is occurring when, whilst conducting your own conversation you become aware of another conversation on the other side of the room, once you hear your name mentioned? How is it that people who live near a railway line may no longer hear the trains go by? What happens when a taxi driver must simultaneously drive in heavy traffic, enter information into the base computer, and deal with complaining passengers? And why is it that sometimes when we are concentrating on a television program, we do not hear other people talking to us?

A "booming buzzing confusion" of sensations is available to our senses. You are probably not aware of the feel of your feet in your shoes, or the sounds happening outside. Obviously, we must be able to focus in on what is important to us at the moment and screen out the irrelevant information. It is as though we have a flashlight beam, which we can shine on only one area at a time. The problem is that there will be times when there is too much important information coming in for us to cope with all at once, or we will miss information which is outside our attentional "beam of light". Or perhaps our attention will stray onto distracting information like financial concerns or physical discomfort.

Psychologists have come up with diagrams to explain how our attention works, and although there are some differences between different approaches, there are also some points of agreement. It is agreed that there is a finite limit to the amount of information that can be processed at any time, and that we have a bottleneck in our information processing system, allowing only a limited amount of information to squeeze through to consciousness at a time. In this sense, our information processing system is sequential rather than parallel. When we feel that we are consciously attending to several things at a time, such as monitoring a radio and holding a conversation, we may in fact be rapidly switching our attention from one to the other.

Obviously, the limits of attention do not prevent us from doing more than one thing at once; we can drive

Marine Mammals: the Evolving Human Factor Giuseppe Notarbartolo di Sciara, Bernd Würsig, 2022-06-08 The seventh volume in the series Ethology and Behavioral Ecology of Marine Mammals describes aspects of the often complex relationship between humans and marine mammals From a primeval condition of occasional predators during the last century humans have become a major factor negatively affecting the status of most marine mammals through over hunting habitat encroachment and environmental degradation This has led to the extirpation of many marine mammal populations and even to the extinction of species However in parallel to this destructive drive since antiquity humanity has been influenced by a strong fascination for marine mammals which contributes today to an increased human appreciation of the natural world admixed with widespread concern for its degrading condition The special status occupied by marine mammals in human imagination and affection stands in stark contrast with the current predicament of many populations still threatened by the doings of Homo sapiens a condition emblematic of the relationship of humanity with nature and key to understanding where humanity is heading

Marine Operations Thiago Gabriel Monteiro, Houxiang Zhang, 2024-06-13 This book investigates how human mental fatigue MF can be objectively measured during demanding maritime operations The maritime domain is characterized by demanding operations These operations can be especially complex and dangerous when they require coordination between different maritime vessels and several maritime operators The best approach to quantify MF is through the use of physiological sensors including electroencephalogram EEG electrocardiogram electromyogram temperature sensor and eye tracker can be applied individually or in conjunction in order to collect relevant data that can be mapped to an MF scale More than simpler sensor fusion this book bridges the gap between relevant sensor data and a quantifiable MF level using both data driven and model based approaches Data driven part investigates the use of different NNs combined for the MF assessment MFA task Among the different architectures tested convolutional neural networks CNN showed the best performance when dealing with multiple physiological data channels Optimization was used to improve the performance of CNN in the cross subject MFA task Testing different combinations of physiological sensors indicated a setup consisting of EEG sensor only was the best option due to the trade off between assessment precision and sensor framework complexity These two factors are of great importance when considering an MFA system that could be implemented in real life scenarios The model based discussion applies the current knowledge about the use of EEG data to characterize MF to develop an MF approach to quantify the progression of MF in maritime operators In the research presented in this book realistic vessel simulators were used as a platform for experimenting with different operational scenarios and sensor setups
