CAD/CAM of Sculptured Surfaces on Multi-axis NC Machine Stepan Pavlovich Radzevich, 2008 Many products are designed with aesthetic sculptured surfaces to enhance their appearance an important factor in customer satisfaction especially for automotive and consumer electronics products In other cases products have sculptured surfaces to meet functional requirements Functional surfaces interact with the environment or with other surfaces Because of this functional surfaces can also be called dynamic surfaces Functional surfaces do not possess the property to slide over itself which causes significant complexity in machining of sculptured surfaces The application of multiaxis numerically controlled NC machines is the only way for an efficient machining of sculptured surfaces Reduction of machining time is a critical issue when machining sculptured surfaces on multiaxis NC machines To reduce the machining cost of a sculptured surface the machining time must be as short as possible

Generation of Surfaces Stephen P. Radzevich, 2014-02-03 A commonly used practice in industry is the machining of sculptured part surfaces on a multi-axis numerical control (NC) machine. While this practice is vital, it is also a costly aspect of the surface generation process. After investing more than 40 years of research into the theory of part surface generation, the author of *Generation of Surfaces: Kinematic Geometry of Surface Machining* considers an approach that provides optimal machining while factoring in the lowest possible cost. This book presents the modern theory of part surface generation with a focus on kinematic geometry of part surface machining on a multi-axis NC machine and introduces key methods for applying the DG/K based approach to part surface generation. The DG/K approach is based on the results of research found in two main areas: differential geometry (DG) of surfaces and kinematics (K) of rigid body in three dimensional Euclidean space (E3). It is an extremely powerful tool for solving a plurality of problems in mechanical manufacturing engineering. The text is presented in three parts: the basics, the fundamentals and applications of part surface generation. The first part of the book provides an

analytical description of part surfaces details the principal elements of the theory of multiparametric motion of a rigid body in E3 space and defines applied coordinate systems The second half introduces the theory of part surface generation and includes an analytical description of contact geometry while the final portion illustrates the potential development of highly effective part surface generation methods The author illustrates the most complex features of the book with examples explains all of the results of analysis mathematically and uses just one set of input parameters the design parameters of the part surface to be machined The book considers practical applications for part surface machining and cutting tool design Developed for use with computer aided design CAD and computer aided machining CAM this text is useful for anyone starting work on new software packages for sculptured part surface machining on a multiaxis NC machine **Geometric**
