Rehabilitation Of Visual Deficits After Brain Injury:

Rehabilitation of Visual Disorders After Brain Injury Josef Zihl, 2000 About twenty percent of patients with acquired brain injury suffer from visual deficits the examination and treatment of these patients therefore represents a particular challenge in its own right Furthermore adequate visual perception is a crucial prerequisite for almost all cognitive and motor activities Despite a long research tradition in visual neuroscience the rehabilitation of cerebral visual deficits has until recently been neglected This book is the first to report systematic observations on spontaneous recovery of cerebral visual deficits after acquired brain injury and the outcome of treating these deficits The whole range of human visual functions and capacities is covered visual field visual acuity and contrast sensitivity visual adaptation color vision visual space perception and visual cognition Additionally there is a special section devoted to patients with central scotoma All treatment procedures described are empirically founded This highly innovative contribution to neuropsychological rehabilitation shows that the study of restitution and compensation of impaired and lost brain functions represents a unique opportunity to increase our understanding of brain plasticity Of interest to both the practitioner and the scientist it aims to stimulate further developments and improvements in the field

Rehabilitation of Visual Disorders After Brain Injury Josef Zihl, 2010-11-01 This thoroughly updated and extended edition covers the various cerebral visual disorders acquired after brain injury as well as the rehabilitation techniques used to treat them These are described within a brain plasticity framework using data from single and group case studies along with follow up observation data This original tailor made approach also includes the recording of eye movements for assessing scanning performance in scene perception and reading The book gives a brief synopsis of the historical background on the subject alongside an outline of intervention designs and methodological difficulties in the field and goes on to discuss the mechanisms and processes that provide the foundations for recovery of function and successful adaptation in visually impaired patients The author concludes by analyzing the importance of the procedures and outcomes of treatments to the reduction of patients visual handicaps The new edition also contains an appendix with recommendations on the case histories diagnostics and treatments It is ideal reading for students in clinical neuropsychology as well as professionals in the fields of neurology visual neuroscience and rehabilitation experts

Rehabilitation of Persons with Traumatic Brain Injury Ronald L. Gorden, 1998 Rehabilitation of Visual Disorders After Brain Injury Josef Zihl, 2002-05 Despite a long research tradition in visual neuroscience the rehabilitation of cerebral visual deficits has until recently been neglected This book is the first to report systematic observations on spontaneous recovery of cerebral visual deficits after acquired brain injury and the outcome of treating these deficits The whole range of human visual functions and capacities is covered visual field visual acuity and contrast sensitivity visual adaptation colour vision visual space perception and visual cognition Additionally there is a special section devoted to patients with central scotoma All treatment procedures described are empirically founded

Neural bases of binocular vision and coordination and their implications in visual training programs Olivier A.

Coubard,2015-10-12 Binocular vision is achieved by five neurovisual systems originating in the retina but varying in their destination within the brain Two systems have been widely studied the retino tectal or retino collicular route which subserves an expedient and raw estimate of the visual scene through the magnocellular pathway and the retino occipital or retino cortical route which allows slower but refined analysis of the visual scene through the parvocellular pathway But there also exist further neurovisual systems the retino hypothalamic retino pretectal and accessory optic systems which play a crucial role in vision though they are less understood The retino pretectal pathway projecting onto the pretectum is critical for the pupillary or photomotor reflex The retino hypothalamic pathway projecting onto the suprachiasmatic nucleus regulates numerous behavioral and biological functions as well as circadian rhythms The accessory optic system targeting terminal lateral medial and dorsal nuclei through the paraoptic fasciculus plays a role in head and gaze orientation as well as slow movements Taken together these neurovisual systems involve 60% of brain activity thus highlighting the importance of vision in the functioning and regulation of the central nervous system But vision is first and foremost action which makes perception impossible without movement Binocular coordination is a prerequisite for binocular fusion of the object of interest on the two foveas thus ensuring visual perception The retino collicular pathway is sufficient to elicit reflexive eye movements with short latencies Thanks to its motor neurons the superior colliculus activates premotor neurons which themselves activate motor neurons of the oculomotor trochlear and abducens nuclei At a higher level a cascade of neural mechanisms participates in the control of decisional eye movements The superior colliculus is controlled by the substantia nigra pars reticulata which is itself gated by subcortical structures such as the dorsal striatum The superior colliculus is also inhibited by the dorsolateral prefrontal cortex through a direct prefrontotectal tract Cortical areas are crucial for the triggering of eye movements the frontal eye field supplementary eye field and parietal eye field Finally the cerebellum maintains accuracy The focus of the present research topic entitled Neural bases of binocular vision and coordination and their implications in visual training programs is to review the most recent findings in brain imaging and neurophysiology of binocular vision and coordination in humans and animals with frontally placed eyes The emphasis is put on studies that enable transfer of knowledge toward visual training programs targeting visual field defects e g hemianopia and binocular functional disorders e g amblyopia Brain Injury Medicine, 2nd Edition Nathan D.
