Autodesk Maya 2020 Character Animation Book Serdar Hakan DÜZGÖREN, Character Animation Before you animate the characters and objects in your scene set up the scene by rigging all your characters and by applying the appropriate constraints and deformers to all the objects you want to animate Rigging a character also known as character setup involves creating skeletons and IK handles for your characters binding skins to the skeletons and setting up deformers and constraints You can also create deformers for your character and animate them to produce effects for example the jiggling belly jiggle deformer furrowing brow wire deformer and flexing biceps lattice deformer of a sumo wrestler model Non character objects are also very important to bringing your scene to life You can limit and control the transformations of objects by constraining them to characters or other models in your scene You can also create deformers for objects to create complex deformation effects For example you can apply a squash deformer to the model of a ball and then parent constrain the ball to the hands of a character With this setup you can key the weights of the character's hands and the squash deformer's attributes to create an animation of the character bouncing the ball from hand to hand while the ball squashes on the ground and stretches as it rises back into the air In addition to setting up characters and objects for animation you can set up Maya Dynamics for animation You can constrain dynamic objects such as particle emitters fields and fluids to objects or characters in your scene For more information see nDynamics Simulation Framework and Fluid Effects

Supraspinal Control of Automatic Postural Responses: Which Pathway Does What? Isaac L. Kurtzer, 2017-07-26 Rapid corrective actions termed automatic postural responses are essential to counter the destabilizing effect of mechanical perturbations during natural behaviors Previous research has demonstrated that automatic postural responses of the limbs and body share a number of capabilities in adapting to the prevailing circumstances and these abilities

reflect contributions from multiple supraspinal pathways including brainstem nuclei basal ganglia and primary motor cortex. However, we do not know the context dependent contribution from specific generators, whether different neural pathways have a common role across different effectors, and how sensory and central deficits in one pathway are accommodated by those remaining. Bridging these gaps is essential to integrate the diverse set of studies, develop general theories of motor control, and explicate how the nervous system addresses the partially distinct behavioral demands of co-evolved effector system. The considerable flexibility and multiple interacting pathways of automatic postural responses also make it ideal for understanding how powerful formal theories like optimal feedback control are achieved by a distributed hierarchical neural network.
