Construction Management and Economics *Ecological Dynamics on*

*Yellowstone's Northern Range* National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Committee on Ungulate Management in Yellowstone National Park, 2002-02-01 Ecological Dynamics on Yellowstone's Northern Range discusses the complex management challenges in Yellowstone National Park. Controversy over the National Park Service's approach of natural regulation has heightened in recent years because of changes in vegetation and other ecosystem components in Yellowstone's northern range. Natural regulation minimizes human impacts including management intervention by the National Park Service on the park ecosystem. Many have attributed these changes to increased size of elk and other ungulate herds. This report examines the evidence that increased ungulate populations are responsible for the changes in vegetation and that the changes represent a major and serious change in the Yellowstone ecosystem. According to the authors, any human intervention to protect species such as the aspen and those that depend on them should be prudently localized rather than ecosystem wide. An ecosystem wide approach such as reducing ungulate populations could be more disruptive. The report concludes that although dramatic ecological change does not appear to be imminent, approaches to dealing with potential human caused changes in the ecosystem including those related to climate change should be considered now. The need for research and public education is also compelling.

Theoretical Aspects of Distributed Computing in Sensor Networks Sotiris Nikolettas, José D.P. Rolim, 2011-01-15 Wireless ad hoc sensor networks has recently become a very active research subject. Achieving efficient fault tolerant realizations of very large highly dynamic complex unconventional networks is a real challenge for abstract modelling, algorithmic design and analysis but a solid foundational and theoretical background seems to be lacking. This book presents high quality contributions by leading experts worldwide on the key algorithmic and complexity theoretic aspects of wireless sensor networks. The intended audience includes researchers and graduate students working on sensor networks and the broader areas of wireless networking and distributed computing as well as practitioners in the relevant application areas. The book can also serve as a text for advanced courses and seminars.
