Sikdar, Frank Princiotta, 2021-01-31 Volume

2 of *Advances in Carbon Management Technologies* has 21 chapters. It presents the introductory chapter again for framing the challenges that confront the proposed solutions discussed in this volume. Section 4 presents various ways biomass and biomass wastes can be manipulated to provide a low carbon footprint of the generation of power, heat, and co-products and of recovery and reuse of biomass wastes for beneficial purposes. Section 5 provides potential carbon management solutions in urban and manufacturing environments. This section also provides state of the art of battery technologies for the transportation sector. The chapters in section 6 deal with electricity and the grid and how decarbonization can be practiced in the electricity sector. The overall topic of advances in carbon management is too broad to be covered in a book of this size. It was not intended to cover every possible aspect that is relevant to the topic. Attempts were made however to highlight the most important issues of decarbonization from technological viewpoints. Over the years, carbon intensity of products and processes has decreased, but the proportion of energy derived from fossil fuels has been stubbornly stuck at about 80%. This has occurred despite very rapid development of renewable fuels because at the same time the use of fossil fuels has also increased. Thus the challenges are truly daunting. It is hoped that the technology choices provided here will show the myriad ways that solutions will evolve. While policy decisions are the driving forces for technology development, the book was not designed to cover policy solutions.

Advances in Carbon Management Technologies Subhas Sikdar, Frank Princiotta, 2020-03-19. *Advances in Carbon Management Technologies* comprises 43 chapters contributed by experts from all over the world. Volume 1 of the book containing 23 chapters discusses the status of technologies capable of yielding substantial reduction of carbon dioxide emissions from major combustion sources. Such technologies include renewable energy sources that can replace fossil fuels and technologies to capture CO₂ after fossil fuel combustion or directly from the atmosphere with subsequent permanent long term storage. The introductory chapter emphasizes the gravity of the issues related to greenhouse gas emission, global temperature correlation, the state of the art of key technologies and the necessary emission reductions needed to meet international warming targets. Section 1 deals with global challenges associated with key fossil fuel mitigation technologies including removing CO₂ from the atmosphere and emission measurements. Section 2 presents technological choices for coal, petroleum and natural gas for the purpose of reducing carbon footprints associated with the utilization of such fuels. Section 3 deals with promising contributions of alternatives to fossil fuels such as hydropower, nuclear, solar, photovoltaics and wind. Chapter 19 of this book is freely available as a downloadable Open Access PDF at <http://www.taylorfrancis.com> under a Creative Commons Attribution Non Commercial No Derivatives CC BY NC ND 4.0 license.
