Manipulation and Expression of Recombinant DNA Sue Carson, Dominique Robertson, 2005-12-15 This manual is an indispensable tool for introducing advanced undergraduates and beginning graduate students to the techniques of recombinant DNA technology or gene cloning and expression The techniques used in basic research and biotechnology laboratories are covered in detail Students gain hands on experience from start to finish in subcloning a gene into an expression vector through purification of the recombinant protein The second edition has been completely re written with new laboratory exercises and all new illustrations and text designed for a typical 15 week semester rather than a 4 week intensive course The project approach to experiments was maintained students still follow a cloning project through to completion culminating in the purification of recombinant protein It takes advantage of the enhanced green fluorescent protein students can actually visualize positive clones following IPTG induction Cover basic concepts and techniques used in molecular biology research labs Student tested labs proven successful in a real classroom laboratories Exercises simulate a cloning project that would be performed in a real research lab Project approach to experiments gives students an overview of the entire process Prep list appendix contains necessary recipes and catalog numbers providing staff with detailed instructions

Experimental Manipulation of Gene Expression Masayori Inouye, 2014-06-28 Experimental Manipulation of Gene Expression discusses a wide range of host systems in which to clone and express a gene of interest The aims are for readers to quickly learn the versatility of the systems and obtain an overview of the technology involved in the manipulation of gene expression Furthermore it is hoped that the reader will learn enough from the various approaches to be able to develop systems and to arrange for a gene of particular interest to express in a particular system The book opens with a chapter on the design and construction of a plasmid vector system used to achieve high level expression of a particular phage regulatory protein normally found in minute amounts in a phage infected bacterial cell This is followed by separate chapters on topics such as high level expression vectors that utilize efficient Escherichia coli lipoprotein promoter as well as various other portions of the lipoprotein gene Ipp DNA cloning systems for streptomycetes and the design and application of vectors for high level inducible synthesis of the product of a cloned gene in yeast

Molecular Biology Techniques Heather B. Miller, D. Scott Witherow, Sue Carson, 2011-10-18 This manual is an indispensable tool for introducing advanced undergraduates and beginning graduate students to the techniques of recombinant DNA technology or gene cloning and expression The techniques used in basic research and biotechnology laboratories are covered in detail Students gain hands on experience from start to finish in subcloning a gene into an expression vector through purification of the recombinant protein The third edition has been completely re written with new laboratory exercises and all new illustrations and text designed for a typical 15 week semester rather than a 4 week intensive course The project approach to experiments was maintained students still follow a cloning project through to completion culminating in the purification of recombinant

protein It takes advantage of the enhanced green fluorescent protein students can actually visualize positive clones following IPTG induction Cover basic concepts and techniques used in molecular biology research labs Student tested labs proven successful in a real classroom laboratories Exercises simulate a cloning project that would be performed in a real research lab Project approach to experiments gives students an overview of the entire process Prep list appendix contains necessary recipes and catalog numbers providing staff with detailed instructions *Gene Transfer and Expression Protocols* Edward J. Murray, 2008-02-02 Biology is the study of living things The classical approach might be described as holistic and descriptive whereas the modern molecular approach aims to be investigative reductionist and mechanistic Genes contain all the information for the structure of all living things thus the understanding of how genes are regulated is an important step toward understanding the nature of living things The study of gene regulation has been made more tractable by the design of simple experimental models in which a single gene can be isolated from the milieu of the organism The new science of molecular biology has introduced techniques that permit the design of such experimental models In sense the genome of the organism is dissected in such a manner that specific genes may now be introduced into an appropriate cell line Subsequent analysis of the proteins expressed from the genes under study results in the identification of the regulatory DNA sequences
