Anatomía descriptiva y anatomía clínica del sistema nervioso en el perro y el gato y Resonancia magnética. Biofísica e interpretación en la patología del sistema nervioso central en veterinaria Vicente Aige Gil,2010-09-17 Este libro se ha estructurado en dos partes una primera de neuroanatomía descriptiva y clínica y una segunda sobre resonancia magnética. En la primera parte se describe el sistema nervioso en el perro y el gato y se hace referencia a los conceptos de neuroma motora superior e inferior. Se aportan detalles de las vías sensitivas de propiocepción y de dolor se aborda el sistema vestibular y se describe el examen neurológico con los signos clínicos que pueden presentarse según la localización de la lesión neurológica. En la segunda parte se explican los principios biofísicos de la resonancia magnética y como interpretar las imágenes normales y de las principales patologías que afectan al encéfalo y a la médula espinal. Por último se incluye un atlas de RM de la cabeza de perro.

Manual de anatomía y embriología de los animales domésticos Salvador Climent Peris,2004 **El encéfalo del perro** Vicente Aige Gil,2002 En los últimos años la profesión veterinaria ha experimentado un avance significativo de las especialidades por lo que se ha hecho imprescindible el uso de las nuevas tecnologías. La utilización de la resonancia magnética RM se ha convertido en una herramienta necesaria en el diagnóstico de disfunciones neurológicas de localización intracraneal en los animales vivos. Esta publicación va dirigida a los estudiantes de veterinaria y a los clínicos. Su objetivo es ayudarles a identificar las principales estructuras anatómicas del encéfalo de perro comparando secciones seriadas en los tres planos obtenidas con RM y secciones de cabezas de cadáveres previamente fijados con una solución de formaldehído. La comparación de las secciones obtenidas con RM y las de cadáveres se hace mediante un programa informático autoejecutable contenido en el CD-ROM.

It shows the anatomical elements of each of these joints in three dimensional diagrams. The views chosen for each case have been selected for a practical purpose showing the position of the elements involved in the most commonly

used surgical approaches It also describes the key orthopaedic conditions affecting each joint and the most commonly used surgical approaches It contains a large number of images and illustrations and a selection of views presented in digital video format **Anatomía de los animales domésticos : texto y atlas en color. 1. Membrane Channels, Receptors and Kinematics Alejandro Vicente Carrillo,2016-10-11 Internal fertilization usually implies that a spermatozoon with intact attributes for zygote formation passes all hurdles during its transport through the female genitalia and reaches the oocyte During this journey millions to billions of other spermatozoa perish Spermatozoa are highly differentiated motile cells without synthetic capabilities They generate energy via glycolysis and oxidative phosphorylation to sustain motility and to maintain the stability and functionality of their plasma membrane In vivo they spend their short lifespan bathing in female genital tract fluids of different origins or are in vitro exposed to defined media during diverse sperm handling i.e. extension cryopreservation in vitro fertilization etc Being excitable cells spermatozoa respond in vivo to various stimuli during pre fertilization capacitation hyperactivation oocyte location and fertilization acrosome reaction interaction with the oocyte events mediated via diverse membrane ion conducting channels and ligand gated receptors The present Thesis has mapped the presence and reactivity sperm intactness and kinematics of selected receptors water and ion channels in ejaculated boar spermatozoa The final aim was to find a relevant alternative cell type for in vitro bioassays that could ease the early scrutiny of candidate drugs as well as decreasing our needs for experimental animals according to the 3R principles Spermatozoa are often extended cooled and thawed to warrant their availability as fertile gametes for breeding or in vitro testing Such manipulations stress the cells via osmotic variations and hence spermatozoa need to maintain membrane intactness by controlling the exchange of water and the common cryoprotectant glycerol via aquaporins AQPs Both AQPs 7 and 9 were studied for membrane domain changes in cauda and ejaculated spermatozoa unprocessed extended chilled or frozen thawed While AQP 9 maintained location through source and handling thawing of ejaculated spermatozoa clearly relocated the labelling of AQP 7 thus appearing as a relevant marker for non empirical studies of sperm

cryopreservation alongside water spermatozoa interact with calcium Ca2 via the main Ca2 sperm channel CatSper. Increments in intracellular Ca2 initiate motility hyperactivation and the acrosome reaction. The four subunits of the CatSper channel were present in boar spermatozoa mediating changes in sperm motility under in vitro capacitation inducing conditions increased extracellular Ca2 availability and bicarbonate or challenge by the CatSper antagonists mibepradil and NNC 55 0396. Uterine and oviduct fluids are richest in endogenous opioids as endorphins during mating and ovulation. Both and opioid receptors were present in boar spermatozoa modulating sperm motility as in vitro challenge with known agonists morphine DPDPE and U 50488 and antagonists naloxone naltrindole and nor binaltrorphimine showed that the opioid receptor maintained or increased motility while the opioid receptor mediated decreased motility over time. Finally boar spermatozoa depicted dose response effects on sperm kinematics and mitochondrial potential following in vitro challenge with 130 pharmacological drugs and toxic compounds as well as with eight known mito toxic compounds. In conclusion boar spermatozoa expressing functional water AQP 7 and 9 and ion CatSper 1 4 channels as well as and opioid receptors are able to adapt to stressful environmental variations capacitation and pharmacological compounds and drug components. Ejaculated sperm suspensions are easily and painlessly obtained from breeding boars and are suitable biosensors for in vitro drug induced testing complying with the 3R principles of reduction and replacement of experimental animals during early toxicology screening.
