

Role of nutrients in brain structure and function

Like any other organ, the brain needs specific nutrients to function properly.^{1,2}

Adult human brain:

Neurons form a communication network by connecting with each other through junctions called synapses.¹

Average number of neurons in the brain⁶:

86,000,000,000

Nutrients are involved in many different synaptic processes, such as neurotransmitter and phospholipid synthesis.¹

Neurotransmitters are the key molecules in the communication at synapses, and their synthesis depends on ingested nutrients.

Estimation of total number of synapses in the cerebral cortex⁷:

60-240 trillion

Phospholipids are major building blocks of synaptic membranes.

Total membrane surface area in the brain⁸:

4x

Phospholipids are made from ingested nutrients, e.g. DHA, uridine, choline, folate.^{1,9}

phospholipid fraction¹⁰:

50%

The brain needs lifelong nourishment to maintain its structure and function and to help ensure optimal cognitive performance.¹

Choline
precursor for the neurotransmitter acetylcholine.

Vitamin B6
cofactor in the synthesis of the neurotransmitters serotonin, dopamine, and noradrenaline.

Vitamin C
cofactor for synthesis of the neurotransmitter noradrenaline.

Folate
essential in the one-carbon metabolism, which is involved in the synthesis of neurotransmitters and phospholipids.

Tryptophan
precursor for the neurotransmitter serotonin.

DHA
docosahexaenoic acid, an omega-3 polyunsaturated fatty acid present in neuronal membranes and which influences membrane-related processes such as neurotransmission.

Vitamin E
antioxidant that protects cell components, like the neuronal membranes, from oxidation by free radicals.

Tyrosine
precursor for the neurotransmitters dopamine and noradrenaline.
