Innovative technical papers in this book cover design optimization and physical partitioning, global routing, multi-layer assignment, timing driven interconnection, design timing models, clock and power design, crosstalk reflection and simultaneous switching noise minimization, yield optimization, defect area minimization, low power physical layout and design methodologies. Two tutorial reviews review some of the most significant algorithms previously developed for the placement partitioning and signal integrity issues respectively. The remaining articles review the trend of prime design automation algorithms to solve the above eight problems which arise in MCMs and other packages.
