Banga, 1997-07-01 From the Preface At the time of this writing the American biotechnology and pharmaceutical industry has more than two dozen biotechnology derived therapeutic proteins on the market while several hundred are in various stages of human clinical trials or at the FDA for review Today more than a thousand companies are involved in biotechnology research with a total revenue of 7.7 billion for 1993 Therapeutic peptides and proteins are expected to mitigate suffering in coming years as anticancer agents hormones growth factors analgesics anti hypertensives and thrombolytics among others However the clinical application of these therapeutic peptides and proteins is limited by several problems such as lack of physical and chemical stability or the lack of desirable

attributes for adequate absorption or distribution Thus as these therapeutic peptides and proteins are made available it will be essential to formulate these drugs into safe stable and efficacious delivery systems The pharmaceutical scientist involved in this effort needs to call upon the knowledge of several disciplines such as pharmaceutics medicinal chemistry biochemistry and microbiology and needs to keep abreast with the latest research in the published literature This book presents these principles in a simple interesting and practically useful manner for the benefit of scientists working in this area and to further research in this area This book will also provide useful information for students and academic researchers and add to their interest in this area The book should also be useful in a hospital setting to understand potential physicochemical stability problems that may result during reconstitution or administration of the new recombinant proteins Since this field is relatively new and rapidly evolving efforts were made to include very recent literature in the book As a result over 40% of the literature citations in the book are for the work published in the last two years

Group 13 Chemistry II H.W. Roesky, David A. Atwood, 2003-08-25 Aluminum bound almost exclusively to oxygen in various combinations is the most abundant metal in the earth's crust and therefore of great commercial potential Once methods were developed in the 1880 s to free useable quantities of the element from oxygen applications for the element began developing rapidly This growth has resulted in the ubiquity of the metal in today's world Therefore it can be found intentionally introduced in many products in direct contact with human beings It is commonly known that soluble forms of aluminum are toxic to living organisms However aluminum is not known to be bioavailable under everyday conditions In fact the solubility product of common aluminum compounds such as $\text{Al}(\text{OH})_3$ is so low as to make it essentially unavailable This volume of Structure and Bonding seeks to provide in one source a resource where the basic science related to aluminum toxicity may be obtained It should be stressed that this volume is not intended to be a warning to avoid contact with aluminum Living organisms have adequate defenses to prevent aluminum toxicity under normal conditions Rather the volume was created to simply provide an understanding of the biological effects of aluminum As such the present volume should be considered in the context of the companion volumes in this three part series

of Structure and Bonding The first volume was devoted to fundamental developments in group 13 chemistry *Remington*
