### *Molecular and Metabolic Mechanisms Associated with Fleshy Fruit Quality* Ana M.

Fortes, Antonio Granell, Mario Pezzotti, Mondher Bouzayen, 2017-09-08 Fleshy Fruits are a late acquisition of plant evolution In addition of protecting the seeds these specialized organs unique to plants were developed to promote seed dispersal via the contribution of frugivorous animals Fruit development and ripening is a complex process and understanding the underlying genetic and molecular program is a very active field of research Part of the ripening process is directed to build up quality traits such as color texture and aroma that make the fruit attractive and palatable As fruit consumers humans have developed a time long interaction with fruits which contributed to make the fruit ripening attributes conform our needs and preferences This issue of Frontiers in Plant Science is intended to cover the most recent advances in our understanding of different aspects of fleshy fruit biology including the genetic molecular and metabolic mechanisms associated to each of the fruit quality traits It is also of prime importance to consider the effects of environmental cues cultural practices and postharvest methods and to decipher the mechanism by which they impact fruit quality traits Most of our knowledge of fleshy fruit development ripening and quality traits comes from work done in a reduced number of species that are not only of economic importance but can also benefit from a number of genetic and genomic tools available to their specific research communities For instance working with tomato and grape offers several advantages since the genome sequences of these

two fleshy fruit species have been deciphered and a wide range of biological and genetic resources have been developed. Ripening mutants are available for tomato which constitutes the main model system for fruit functional genomics. In addition, tomato is used as a reference species for climacteric fruit which ripening is controlled by the phytohormone ethylene. Likewise, grape is a reference species for non-climacteric fruit even though no single master switches controlling ripening initiation have been uncovered yet. In the last period, the genome sequence of an increased number of fruit crop species became available which creates a suitable situation for research communities around crops to get organized and information to be shared through public repositories. On the other hand, the availability of genome-wide expression profiling technologies has enabled an easier study of global transcriptional changes in fruit species where the sequenced genome is not yet available. In this issue, authors will present recent progress including original data as well as authoritative reviews on our understanding of fleshy fruit biology focusing on tomato and grape as model species.

**Omics in Seed Development: Challenges and Opportunities for Improving of Seed Quality and Yield in Model and Crop Plants** Daoquan Xiang, Zhaorong Hu, Raju Datla, 2025-03-06

Seed development represents an important phase of the life cycle in sexually reproducing plant species. A seed is a complex organ system of three components: the embryo that contributes to germline continuity, endosperm for nourishment, and the seed coat for protection. The developmental programs and the associated events that culminate in the production of a mature seed are highly complex and require precisely coordinated integration of the genetic, molecular, biochemical, metabolic, and physiological pathways and their interactions with environmental cues. Research advances in seed development using model and crop species such as *Arabidopsis*, rice, maize, wheat, and Brassica species have uncovered several key genes and pathways that regulate the cell and tissue specification, differentiation, and growth programs. The key findings from these studies are helping to develop a framework for advancing the knowledge and understanding of the process and the underpinning molecular mechanisms of an embryo, endosperm, and seed coat development. However, knowledge gaps still exist in understanding the regulating networks and metabolic programs involved in defining several important seed traits associated with seed quality and yield, especially in crop plants. Continued rapid advances in omics technologies have contributed to the development of several critical tools for performing genome, epigenome, transcriptome, proteome, and metabolome studies and their applications in seed development. Bioinformatics and computational tools are also playing important contributions in the large-scale genome-wide systems level analysis, modeling, and predictions to identify and characterize the underpinning mechanisms that support seed formation. A holistic understanding of the complexities and interactions that drive seed development is becoming increasingly possible with the application of omics tools to decipher gene, protein, and metabolite networks. In the proposed Research Topic, we highlight current advances in genomics, proteomics, lipidomics, metabolomics, metagenomics, transcriptomics, and phenomics studies of seed development in both model and crop species. We aim to further elucidate how these key genetic regulators and pathway

genes act together to control cell division patterning differentiation and storage reserve accumulation during seed development how these critical processes coordinate to define the seed as a whole and how the genetic and regulatory networks function to generate tremendous natural diversity in the size number and compositional aspects of plant seeds

Shou,Alexander Arthur Theodore Johnson,Raul Antonio Sperotto,2019-09-23 **The Future of Rice Demand: Quality Beyond Productivity** Antonio Costa de Oliveira,Camila Pegoraro,Vívia Ebeling Viana,2020-03-27 This book aims to provide

an overview of the challenges and available technologies to improve rice and provide a response to the challenge posed by increasing world population and the resultant food shortages Nutritional aspects of rice products and omics and the molecular technologies currently being used are covered in depth As a staple food for over 50% of the world s population an estimated 9 billion people will need to be fed by 2050 and healthy and uncontaminated foods need to reach consumers in developed and developing countries This makes quality beyond productivity incredibly important and is one of the overriding themes of this work The Future of Rice Demand Quality Beyond Productivity offers researchers a better understanding of the nutritional aspects of rice Omics technologies applied to cereal grain quality have been scarce in the literature published to date making this text an excellent single source for researchers in regions where rice is a major crop The first section of the book focuses on the major aspects of the industrial processing of all rice types Further sections look at contamination prevention and biofortification special rice types and omics and other molecular tools used in the mass production and processing of healthy rice products *Quality of Horticultural Crops: A Recurrent/New Challenge for Plant Scientists in a Changing World* Nadia Bertin,Michel Génard,Maarten Hertog,2018-10-11 Besides increasing crop yield to feed the growing

population improving crop quality is a challenging and key issue Indeed quality determines consumer acceptability and increases the attractivity of fresh and processed products In this respect fruit and vegetables which represent a main source of vitamins and other health compounds play a major role in human diet This is the case in developing countries where populations are prone to nutritional deficiencies but this is also a pending issue worldwide where the growing middle class is increasingly aware and in search of healthy food So a future challenge for the global horticultural industry will be to answer the demand for better quality food in a changing environment where many resources will be limited This e collection collates state of the art research on the quality of horticultural crops covering the underlying physiological processes the genetic and environmental controls during plant and organ development and the postharvest evolution of quality during storage and
