CO2 Sequestration and Valorization Claudia R. V. Morgado, Victor Esteves, 2014-03-12 The reconciliation of economic development, social justice and reduction of greenhouse gas emissions is one of the biggest political challenges of the moment. Strategies for mitigating CO2 emissions on a large scale using sequestration, storage and carbon technologies are priorities on the agendas of research centres and governments. Research on carbon sequestration is the path to solving major sustainability problems of this century, a complex issue that requires a scientific approach and multidisciplinary and interdisciplinary technology plus a collaborative policy among nations. Thus this challenge makes this book an important source of information for researchers, policymakers and anyone with an inquiring mind on this subject.

Updates in Volcanology Francesco Stoppa, 2012-01-13 This book ranges from the geologic, petrologic description of world-wide major volcanic fields unfamiliar to international literature to the discussion and interpretation of the results in light of geophysical techniques. It focuses on several situations that represent large-scale volcanism on Earth related both with intra-plate or active margins. Many large volcanic complexes of Eastern countries are presented including Japan, Siberia, Russia and Mongolia. A detailed account of the European volcanic province of the Pannonia basin and Central Southern Spain is given. Southern hemisphere areas of Antarctica and Polynesia are considered as well. The chapters are very informative for those who wish for a guide to visiting or are curious about main characteristics of the above volcanic areas, some of which are remote and not easily accessible.

Numerical Simulation of Pore-scale Heterogeneity and Its Effects on Elastic, Electrical and Transport Properties Ratnanabha Sain, 2010 This dissertation describes numerical experiments quantifying the influence of pore-scale heterogeneities and their evolution on macroscopic elastic, electrical and transport properties of porous media. We design, implement and test a computational recipe to construct granular packs and consolidated microstructures replicating geological processes and to estimate the link between process to property trends. This computational recipe includes five constructors: a Granular Dynamics (GD) simulation, an Event-Driven Molecular Dynamics (EDMD) simulation and three computational diagenetic schemes and four property estimators based on GD for elastic, finite elements (FE) for elastic and electrical conductivity and Lattice Boltzmann method (LBM) for flow property simulations. Our implementation of GD simulation is capable of constructing realistic frictional jammed sphere packs under isotropic and uniaxial stress states. The link between microstructural properties in these packs like porosity and coordination number (average number of contacts per grain) and stress states due to compaction is non-unique and depends on assemblage process and inter-granular friction. Stable jammed packs having similar internal stress and coordination number (CN) can exist at a range of porosities (38-42%) based on how fast they are assembled or compressed. Similarly, lower inter-grain friction during assemblage creates packs with higher coordination number and lower porosity at the same stress. Further, the heterogeneities in coordination number

spatial arrangement of contacts the contact forces and internal stresses evolve with compaction non linearly These pore scale heterogeneities impact effective elastic moduli calculated by using infinitesimal perturbation method Simulated stress strain relationships and pressure dependent elastic moduli for random granular packs show excellent match with laboratory experiments unlike theoretical models based on Effective Medium Theory EMT We elaborately discuss the reasons why Effective Medium Theory EMT fails to correctly predict pressure dependent elastic moduli stress strain relationships and stress ratios in uniaxial compaction of granular packs or unconsolidated sediments We specifically show that the unrealistic assumption of homogeneity in disordered packs and subsequent use of continuum elasticity based homogeneous strain theory creates non physical packs which is why EMT fails In the absence of a rigorous theory which can quantitatively account for heterogeneity in random granular packs we propose relaxation corrections to amend EMT elastic moduli predictions These pressure dependent and compaction dependent isotropic or uniaxial correction factors are rigorously estimated using GD simulation without non physical approximations Further these correction factors heuristically represent the pressure dependent heterogeneity and are also applicable for amending predictions of theoretical cementation models which are conventionally used for granular packs For predicting stress ratios in uniaxial compaction scenario we show the inappropriateness of linear elasticity based equations which use elastic constants only and do not account for dissipative losses like grain sliding We further implement and test a computational recipe to construct consolidated microstructures based on different geological scenarios like sorting compaction cementation types and cement materials Our diagenetic trends of elastic electrical and transport properties show excellent match with laboratory experiments on core plugs This shows the feasibility of implementing a full scale computational rock physics based laboratory to construct and estimate properties based on geological processes However the elastic property estimator FE simulation shows limitations of finite resolution while computing elastic properties of unconsolidated sediments and fluid saturated microstructures
