provided chemists their first in depth understanding related to the nature of chemical reactions Another cornerstone which dealt with the inherent property of all matter came a few years later in the form of atomic theory advanced in 1805 by an English schoolteacher John Dalton This theory puts forward the theory that matter constitutes of small particles which are named atoms and that chemical changes take place between atoms or groups of atoms Finally being equipped with in depth views about the nature of matter and of chemical reactions chemistry began making rapid strides Very soon one after the other the gas laws of Joseph Louis Gay Lussac and that of Joseph Louis Proust s law of definite proportions came into being In this period too came the hypothesis of Amedeo Avogadro an Italian chemist about the number of molecules in a volume of gas To Dalton s theory that the atoms of a single element have the same weight Avogadro in 1811 added the idea that one quart or other volume of a gas has the number of molecules which are exactly same as that of any other gas with an equal volume if both are allowed to rest at the same temperature and pressure      *Municipal Journal and Public Works* ,1902
