**Statistical and Probabilistic Models in Reliability** Nikolaos Limnios, Dumitru Cezar Ionescu, 2012-12-06 This volume consists of twenty four papers selected by the editors from the sixty one papers presented at the 1st International Conference on Mathematical Methods in Reliability held at the Politehnica University of Bucharest from 16 to 19 September 1997 The papers have been divided into three sections statistical methods probabilistic methods and special techniques and applications Of course as with any classification some papers could be as well assigned to other sections Problems in reliability are encountered in items in everyday usage Reliability is an important feature of household appliances cars telephones power supplies and so on whether viewed from the vantage of the producer or the consumer Important decisions are based on the reliability of the product Obtaining systems that perform adequately for a specified period of time in a given environment is an important goal for both government and industry Hence study and use of reliability theory which can be applied in the research development and production phases of a system to enable the user to evaluate and improve performance is a worthwhile venture If reliability theory is to be useful it must be quantitative in nature because reliability must be demonstrable Subsequently probability and statistics among others play an important part in its development

### **Emission estimation based on traffic models and measurements** Nikolaos

Tsanakas, 2019-04-24 Traffic congestion increases travel times but also results in higher energy usage and vehicular emissions To evaluate the impact of traffic emissions on environment and human health the accurate estimation of their rates

and location is required Traffic emission models can be used for estimating emissions providing emission factors in grams per vehicle and kilometre Emission factors are defined for specific traffic situations and traffic data is necessary in order to determine these traffic situations along a traffic network The required traffic data which consists of average speed and flow can be obtained either from traffic models or sensor measurements In large urban areas the collection of cross sectional data from stationary sensors is a costefficient method of deriving traffic data for emission modelling However the traditional approaches of extrapolating this data in time and space may not accurately capture the variations of the traffic variables when congestion is high affecting the emission estimation Static transportation planning models commonly used for the evaluation of infrastructure investments and policy changes constitute an alternative efficient method of estimating the traffic data Nevertheless their static nature may result in an inaccurate estimation of dynamic traffic variables such as the location of congestion having a direct impact on emission estimation Congestion is strongly correlated with increased emission rates and since emissions have location specific effects the location of congestion becomes a crucial aspect Therefore the derivation of traffic data for emission modelling usually relies on the simplified traditional approaches The aim of this thesis is to identify quantify and finally reduce the potential errors that these traditional approaches introduce in an emission estimation analysis According to our main findings traditional approaches may be sufficient for analysing pollutants with global effects such as CO<sub>2</sub> or for large scale emission modelling applications such as emission inventories However for more temporally and spatially sensitive applications such as dispersion and exposure modelling a more detailed approach is needed In case of cross sectional measurements we suggest and evaluate the use of a more detailed but computationally more expensive data extrapolation approach Additionally considering the inabilities of static models we propose and evaluate the post processing of their results by applying quasi dynamic network loading
