Supervisory Control Theory SCT provides a tool to model and control human engineered complex systems such as computer networks World Wide Web identification and spread of malicious executables and command control communication and information systems Although there are some excellent monographs and books on SCT to control and diagnose discrete event systems there is a need for a research monograph that provides a coherent quantitative treatment of SCT theory for decision and control of complex systems This new monograph will assimilate many new concepts that have been recently reported or are in the process of being reported in open literature The major objectives here are to present a a quantitative approach supported by a formal theory for discrete event decision and control of human engineered complex systems and b a set of applications to emerging technological areas such as control of software systems malicious executables and complex engineering systems The monograph will provide the necessary background materials in automata theory and languages for supervisory control It will introduce a new paradigm of language measure to quantitatively compare the performance of different automata models of a physical system A novel feature of this approach is to generate discrete event robust optimal decision and control algorithms for both military and commercial systems Human and Nature Minding Automation

Matthews, 2018-09-03 Neurocognitive and Physiological Factors During High Tempo Operations features world renowned scientists conducting groundbreaking research into the basic mechanisms of stress effects on the human body and psyche as well as introducing novel pharmaceuticals and equipment that can rescue or improve maximal performance during stress Its focus is on the military model as an exemplar for high stress environments the best for understanding human performance under stress both in the short term as well as in the long term The unprecedented demands on the modern soldier include constantly shifting enemy threat levels and tactics ambiguous loyalties rapidly evolving weaponry and the need to amass

comprehend retain and act upon large datasets of information During high tempo operations soldiers must maintain superior cognitive and physical skill levels throughout extended periods of little to no sleep Furthermore although a soldier fresh from training may perform at peak skill the effects of cognitive and physical strain and sleeplessness during deployment can impair his or her ability to transfer instructional knowledge to complex real life situations It is necessary to understand how intense workloads both mental and physical combine with total sleep deprivation to alter soldier situation awareness decision making and physical abilities The resulting knowledge can be used to design rapid deployable fitness for duty measures alter training protocols and assess training efficacy in order to enable decision makers to act at peak ability during high operations tempo In addition dual use applications of resulting knowledge and technology extend well into the civilian sector to law enforcement officers healthcare professionals and emergency responders The book differs from many previous human factors publications by presenting state of the art neuroscience data in a format that is comprehensible and informative for readers of diverse backgrounds It not only details human behaviors and perception but also provides concise brain imagery and physiological findings to support its conclusions In addition the incorporation of the US Army soldier model of extreme stress and extreme performance demands provides a real life theme that anchors the scientific organizational assessment and response aspects of each chapter This book synthesizes hard facts with real life accounts of performing under stress and shows how a large oversight institution like the US Army can measure and improve human factors considerations for its members

Ongoing advances in science and engineering enable mankind to design and operate increasingly sophisticated systems Both their design and operation require the understanding of the system and its interaction with the environment This necessitates the formalisation of the knowledge about the system by models A major issue is what kind of model is best suited for a given task This book is about the supervision of continuous dynamical systems Such systems are typically described by differential equations However this does not automatically mean that differential equations are proper models for solving supervision tasks Instead this book and recent approaches in literature show that supervision tasks do in general not require the use of such precise models as differential equations This is of interest because uncertainties typically occurring in supervision make the use of precise models very difficult Alternative approaches therefore use less precise models such as discrete event descriptions to solve supervision tasks on a higher level of abstraction Discrete event descriptions in form of automata are one of the key elements of this book To reach this higher level of abstraction uncertainties by quantisation are introduced on purpose taking into account a loss of precision This is one of the main difference to other approaches When using numerical models like transfer functions or differential equations uncertainties make the analysis more difficult Not so here where the system is described on a qualitative level on which uncertainties are naturally incorporated The book presents a new way to describe systems for supervision
