Bounded Queries in Recursion Theory William S. Levine, Georgia Martin, 1998-12-23 One of the major concerns of theoretical computer science is the classification of problems in terms of how hard they are The natural measure of difficulty of a function is the amount of time needed to compute it as a function of the length of the input Other resources such as space have also been considered In recursion theory by contrast a function is considered to be easy to compute if there exists some algorithm that computes it We wish to classify functions that are hard i e not computable in a quantitative way We cannot use time or space since the functions are not even computable We cannot use Turing degree since this notion is not quantitative Hence we need a new notion of complexity much like time or space that is quantitative and yet in some way captures the level of difficulty such as the Turing degree of a function
