Fluid Mechanics for Marine Ecologists Stanislaw R. Massel, 2012-12-06 The future quality of life on Earth fundamentally depends on trends in world climate. The oceans play a dominant role in regulating global climate by helping to control greenhouse gases, global heat transfer and weather patterns. If we also consider the energy and other resources, oceans offer their essential importance to human existence, become obvious. Ocean waters are in endless motions. Scales of these motions vary from micro turbulence through to surface and internal waves, tides and global currents of planetary dimensions. However, in each case, the water motion satisfies the fundamental fluid mechanics and geophysical fluid mechanics principles. Oceans are not empty but support a large variety of organisms and plants. Many of the basic attributes of life of these creatures raise such questions as why are the ocean's living resources distributed as they are, how can cyclical changes overthrow the system, why do organisms have a particular size and shape, how do they move and reproduce, how do they capture food and many others. In the majority of situations, biological processes appear to be strongly influenced by the physics, while the physical processes are largely independent of the biology. However, when we consider a time scale of thousands of years, the feedback from biology to physics is not so simple. The present composition of the Earth's atmosphere and the present average temperature at the surface of the Earth have been strongly influenced by living organisms.
