Energy Research Abstracts ,1990 **Recent Trends in Fuel Cell Science and Technology** S. Basu, 2007-10-20 Fuel cell science and technology is evolving fast for the past two decades as it is thought to be an efficient way of transforming chemical energy of hydrogen rich compounds to electrical energy Although this idea of direct conversion of chemical energy to electrical energy was first demonstrated by Sir William Grove in 1839 using a fuel cell it was only in

the middle of the twentieth century when Bacon's pioneering work led to the use of fuel cell in space missions. The interest in commercialization of fuel cell for civilian use has caught up with government organizations and private corporations for the past decade on account of fluctuating oil prices and environmental concerns. It is well known that the conventional fossil fuel which is a primary source of gasoline is not going to last more than a hundred years in the face of ever increasing demand in the developed and developing countries. Although the reserves of natural gas, coal and tar sands may last another two to three hundred years with the current rate of production, their conversion is not efficient and pollution free. Thus scientists all over the world have taken up fuel cell development work in their quest of solution to the energy crises looming largely on global population. This book aims to script the present status of the rapidly developing field of fuel cell science and technology.

Photochemistry and Photophysics of Polymeric Materials Norman S. Allen, 2010-03-22. Presents the state of the technology from fundamentals to new materials and applications. Today's electronic devices, computers, solar cells, printing, imaging, copying and recording technology to name a few, all owe a debt to our growing understanding of the photophysics and photochemistry of polymeric materials. This book draws together, analyzes and presents our current understanding of polymer photochemistry and photophysics. In addition to exploring materials, mechanisms, processes and properties, the handbook also highlights the latest applications in the field and points to new developments on the horizon. *Photochemistry and Photophysics of Polymer Materials* is divided into seventeen chapters including Optical and luminescent properties and applications of metal complex based polymers, Photoinitiators for free radical polymerization reactions, Photovoltaic polymer materials, Photoimaging and lithographic processes in polymers, Photostabilization of polymer materials, Photodegradation processes in polymeric materials. Each chapter, written by one or more leading experts and pioneers in the field, incorporates all the latest findings and developments as well as the authors' own personal insights and perspectives. References guide readers to the literature for further investigation of individual topics. Together, the contributions represent a series of major developments in the polymer world in which light and its energy have been put to valuable use. Not only does this reference capture our current state of knowledge but it also provides the foundation for new research and the development of new materials and new applications.

Polymer Photodegradation J.F. Rabek, 2012-12-06 During the last two decades the production of polymers and plastics

has been increasing rapidly In spite of developing new polymers and polymeric materials only 40 60 are used commercially on a large scale It has been estimated that half of the annual production of polymers is employed outdoors The photochemical instability of most polymers limits their outdoor application as they are photodegraded quickly over periods from months to a few years To the despair of technologists and consumers alike photodegradation and environmental ageing of polymers occur much faster than can be expected from knowledge collected in laboratories In order to improve polymer photostability there has been a very big effort during the last 30 years to understand the mechanisms involved in photodegradation and environmental ageing This book represents the author s attempt based on his 25 years experience in research on photodegradation and photo stabilization to collect and generalize a number of available data on the photodegradation of polymers The space limitation and the tremendous number of publications in the past two decades have made a detailed presentation of all important results and data difficult The author apologizes to those whose work has not been quoted or widely presented in this book Because many published results are very often contradictory it has been difficult to present a fully critical review of collected knowledge without antagonizing authors For that reason all available theories mechanisms and different suggestions have been presented together and only practice can evaluate which of them are valid
