CONLAN Report R. Piloty, M. Barbacci, D. Borrione, D. Dietmeyer, 1983-03 *The JR Programming Language* Ronald A. Olsson, Aaron W. Keen, 2006-04-18 JR is a language for concurrent programming It is an imperative language that provides explicit mechanisms for concurrency communication and synchronization JR is an extension of the Java programming language with additional concurrency mechanisms based on those in the SR Synchronizing Resources programming language It is suitable for writing programs for both shared and distributed memory applications and machines it is of course also suitable for writing sequential programs JR can be used in applications such as parallel computation distributed systems simulation and many others JR supports many features useful for concurrent programming However our goals have always been keeping the language simple and easy to learn and use We have achieved these goals by integrating common notions both sequential and concurrent into a few powerful mechanisms We have implemented these mechanisms as part of a complete language to determine their feasibility and cost to gain hands on experience and to provide a tool that can be used for research and teaching The introduction to Chapter 1 expands on how JR has realized our design goals

its subsystems and a prototypical realization of a proper business scenario are presented Thus the book goes way beyond current service based software technologies by providing a coherent and consistent set of technologies and systems functionality that realizes advanced concepts in service provisioning Both the use case scenario and the provisioning platform have already been substantiated and implemented by the EU funded Adaptive Services Grid project The book therefore presents state of the art research results that have already passed a real industrial implementation evaluation which is based on the work of over 20 European partners cooperating in the field of semantic service provisioning

Models of Action Clive D.L. Wynne, John E.R. Staddon, 2013-06-17 This volume presents an international group of researchers who model animal and human behavior both simple and complex The models presented focus on such subjects as the pattern of eating in meals and bouts the energizing and shaping impact of reinforcers on behavior transitive inferential reasoning responding to a compound stimulus avoidance and escape learning recognition memory category formation generalization the timing of adaptive responses and chromosomes exchanging information The chapters are united by a common interest in adaptive behavior whether of human animal or artificial system and clearly demonstrate the rich variety of ways in which this fascinating area of research can be approached In so doing the book demonstrates the range of thought that qualifies as theorizing in the contemporary study of the mechanisms of adaptive behavior It has two purposes to bring together a very wide range of approaches in one place and to give authors space to explain how their ideas developed Journal literature often presents fully formed theories with no explanation of how an idea came to have the shape in which it is presented In this volume however leaders in different fields provide background on the development of their ideas Where once psychologists and a few zoologists had this field to themselves now various types of computer scientists have added great energy to the mix

Genetic Programming III John R. Koza, 1999 Genetic programming GP is a method for getting a computer to solve a problem by telling it what needs to be done instead of how to do it Koza Bennett Andre and Keane present genetically evolved solutions to dozens of problems of design control classification system identification and computational molecular biology Among the solutions are 14 results competitive with human produced results including 10 rediscoveries of previously patented inventions
