Emerging Research on Networked Multimedia Communication Systems Kanellopoulos, Dimitris, 2015-08-14

Mobile Multimedia Communications David J. Goodman, Dipankar

Raychaudhuri, 2013-11-11 In 1997 the two hottest topics in information technology are the Internet and mobile communications. Each one has the enthusiastic attention of the consuming public, investors and the technical community. In a time of rapid expansion they both face technical obstacles to meeting the public's high expectations. This situation stimulates a high volume of research in both areas. To bring the Internet into the twenty-first century the research community focuses on multimedia communications in which integrated systems store, transport and process many types of information simultaneously. A major challenge is to meet the requirements of each information service. This problem is separate performance requirements, especially challenging when a system has to deliver broadband real-time services such as full-motion video. Meanwhile the mobile communications research community continues its long-term struggle against the triple challenge of mobility, ether and energy. Mobility refers to the changing locations of terminals. When terminals are mobile networks have to determine their locations and dynamically establish routes for information. The networks also have to rearrange themselves in order to maintain links to terminals with active communications sessions. Ether refers to the problems of wireless communications including limited bandwidth, rapidly changing radio propagation conditions, mutual interference of radio signals and vulnerability of systems to eavesdropping and unauthorized access. Energy refers to the fact that portable information devices carry their own power sources. The rate at which the batteries of cellular telephones and portable computers drain their energy has a strong effect on their utility.
