Standard Guide for Nondestructive Evaluation of Nuclear Grade Graphite¹

This standard is issued under the fixed designation D8093; the number immediately following the designation indicates the year of original adoption or, in the case of revisions, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope²

1.1 This guide provides general tutorial information regarding the application of conventional nondestructive evaluation technologies (NDE) to nuclear grade graphite. An introduction will be provided to the characteristics of graphite that defines the inspection technologies that can be applied and the limitations imposed by the microstructure. This guide does not provide specific techniques or acceptance criteria for end-user examinations but is intended to provide information that will assist in identifying and developing suitable approaches.

1.2 The values stated in SI units are to be regarded as the standard.

1.2.1 *Exception*—Alternative units provided in parentheses are for information only.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and health/environmental practices and determine the applicability of regulatory limitations prior to use.*

1.4 *This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.*

3. Summary of Guide

3.1 This guide describes the impact specific material properties have on the application of three nondestructive evaluation technologies: Eddy current/electromagnetic testing (ET) (surface/in-situ surface interrogation), ultrasonic testing (UT) (volumetric interrogation), radiographic (X-ray) testing (RT) (volumetric interrogation), to nuclear grade graphite.

4. Significance and Use

4.1 Nuclear grade graphite is a composite material made from petroleum or a coal-tar-based coke and a pitch binder. Manufacturing graphite is an iterative process of baking and pitch impregnation of a formed billet prior to final graphitization, which occurs at temperatures greater than 2500 °C. The impregnation and rebake step is repeated several times until the desired product density is obtained. Integral to this process is the use of isotropic cokes and a forming process (that is, isostatically molded, vibrationally molded, or extruded) that is intended to obtain an isotropic or near isotropic material. However, the source, size, and blend of the starting materials as well as the forming process of the green billet will impart unique material properties as well as variations within the final product. There will be density variations from the billet surface inward and different physical properties with and transverse to the grain direction. Material variations are expected within individual billets as well as billet-to-billet and

Review of Progress in Quantitative Nondestructive Evaluation Donald O. Thompson, Dale E. Chimenti, 2012-12-06 The objective of this study was to increase the understanding of damage in composite materials with through the thickness reinforcements As a first step it was necessary to develop new ultrasonic imaging technology to better assess internal damage of the composite A useful ultrasonic imaging technique has been successfully developed to assess the internal damage of composite panels The ultrasonic technique accurately determines the size of the internal damage It was found that the ultrasonic imaging technique was better able to assess the damage in a composite panel with through the thickness reinforcements than by destructively sectioning the specimen and visual inspection under a microscope Microscopic determination of crack location and lengths in a composite panel with through the thickness reinforcements was almost impossible Five composite compression after impact panels were tested The compression after impact strength of the panels with the through the thickness reinforcements was almost twice that of the comparable panel without through the thickness reinforcement REFERENCES 1 B T Smith J S Heyman A M Buoncristiani Earl D Blodgett J G Miller and S M Freeman Correlation of the Deply TechniQue with the Ultrasonic Imaging of Impact Damage in Graphite Epoxy Composites Materials Evaluation vol 47 NO 12 December 1989 pp 1408 1416 2 NASA Tech Briefs June 1987 p 28 3 P M Gammel Improved Ultrasonic Detection using Analytic Signal Magnitude Ultrasonics Vol 19 March 1981 pp 73 76 4 R C Heyser Determination of Loudspeaker Signal Arrival Times Part Journal of the Audio Engineering Society Vol 19 Dec 1971 pp 902 905
