## **Recent Developments In Domain Decomposition Methods:**

*Recent Developments in Domain Decomposition Methods* Luca F. Pavarino, Andrea Toselli, 2012-12-06 The main goal of this book is to provide an overview of some of the most recent developments in the field of Domain Decomposition Methods. Domain decomposition relates to the construction of preconditioners for the large algebraic systems of equations which often arise in applications by solving smaller instances of the same problem. It also relates to the construction of approximation methods built from different discretizations in different subdomains. The resulting methods are among the most successful parallel solvers for many large scale problems in computational science and engineering. The papers in this collection reflect some of the most active research areas in domain decomposition such as novel FETI, Neumann-Neumann overlapping, Schwarz and Mortar methods.

*Domain Decomposition Methods in Science and Engineering XVI* Olof B. Widlund, David E. Keyes, 2007-01-19 Domain decomposition is an active research area concerned with the development, analysis and implementation of coupling and decoupling strategies in mathematical and computational models of natural and engineered systems. The present volume sets forth new contributions in areas of numerical analysis, computer science, scientific and industrial applications and software development.

*Domain Decomposition Methods - Algorithms and Theory* Andrea Toselli, Olof Widlund, 2006-06-20 This book offers a comprehensive presentation of some of the most successful and popular domain decomposition preconditioners for finite and spectral element approximations of partial differential equations. It places strong emphasis on both algorithmic and mathematical aspects. It covers in detail important methods such as FETI and balancing Neumann-Neumann methods and algorithms for spectral element methods.

Hoppe, Jacques Periaux, Olivier Pironneau, Olof Widlund, Jinchao Xu, 2006-03-30 Domain decomposition is an active interdisciplinary research area that is devoted to the development, analysis and implementation of coupling and decoupling strategies in mathematics, computational science, engineering and industry. A series of international conferences starting in 1987 set the stage for the presentation of many, meanwhile classical, results on substructuring, block iterative methods, parallel and distributed high performance computing, etc. This volume contains a selection from the papers presented at the 15th International Domain Decomposition Conference held in Berlin, Germany, July 17-25, 2003, by the world's leading experts in the field. Its special focus has been on numerical analysis, computational issues, complex heterogeneous problems, industrial problems and software development.

Lines, 2016-04-19 Flow of ions through voltage gated channels can be represented theoretically using stochastic differential equations where the gating mechanism is represented by a Markov model The flow through a channel can be manipulated using various drugs and the effect of a given drug can be reflected by changing the Markov model These lecture notes provide an accessible introduction to the mathematical methods needed to deal with these models They emphasize the use of numerical methods and provide sufficient details for the reader to implement the models and thereby study the effect of various drugs Examples in the text include stochastic calcium release from internal storage systems in cells as well as stochastic models of the transmembrane potential Well known Markov models are studied and a systematic approach to including the effect of mutations is presented Lastly the book shows how to derive the optimal properties of a theoretical model of a drug for a given mutation defined in terms of a Markov model
