**Geoengineering of the Climate System** R M Harrison, R E Hester, 2014-05-08 It is generally accepted within the

scientific community that anthropogenic emissions of greenhouse gases are primarily responsible for a recent warming in global climate and that current trajectories of emissions may lead to potentially catastrophic changes in climate. While reduction in emissions of greenhouse gases and particularly carbon dioxide could lead to a stabilisation of global temperatures, this requires international agreements which have yet to be achieved. A possible alternative which has been widely mooted is to use methods known as geoengineering as an alternative way of limiting increases in global temperature. Geoengineering techniques fall into two main categories of carbon dioxide removal and solar radiation management; within each of these there are a number of options. Following on from Carbon Capture volume 29 in this series, *Geoengineering of the Climate System* presents an overview of the technologies currently being considered as large scale solutions to climate change and considers some of the possible benefits and disadvantages of each. Invited contributions have been received by many of the leading experts on these technologies and the volume provides a comprehensive overview of both carbon dioxide reduction and solar radiation management methods. These give rise to important ethical and governance issues which are also explored. Written with active researchers, postgraduate students and policy makers in mind, the latest addition to the *Issues in Environmental Science Technology* series presents a balanced and informed view of this important field of research and is an essential addition to any environmental science library.

**Food Safety and Food Quality** Ronald E. Hester, Roy M. Harrison, 2001. The quality and safety of the food we eat is discussed in this book which brings together experts to present overviews on a wide range of topics including GM crops, hazardous micro organisms such as E coli, the BSE/CJD problem and cancer causing chemicals, both natural and synthetic.

*Marine Pollution and Human Health* R E Hester, R M Harrison, 2011-09-20. There is growing concern about the state of the world's oceans. The rapid growth of human populations in coastal regions has led to increasing dependence on marine resources. Beneficial features related to food supply and life style need to be balanced against the hazards presented by microbial pathogens, chemical pollutants and toxic algal blooms. In this book a group of experts from a range of backgrounds review the key aspects of the marine environment in relation to human health. An initial overview explains the need for integrating a range of disciplines from physical oceanography and marine biology to molecular biology and epidemiology. Only by this approach can we hope to predict the consequences of environmental change and exploitation of natural resources upon our coastal ecosystems and ultimately on society and human health. Subsequent chapters then focus on more specialized topics. Firstly, waterborne pathogens are reviewed in detail and the microbial measures and policy implications important for protecting humans from exposure are described. Next, the consumption of contaminated seafood is considered along with its implications regarding the growth of aquaculture. Priority pollutants, emerging contaminants and plastics are investigated as are the effects of climate change on pollution. Some phytoplankton produce biotoxins which accumulate in the flesh of filter feeders such as bivalve molluscs. This creates a health risk when the shellfish are consumed by humans. The penultimate chapter therefore concentrates on harmful algal

blooms HABs and the methodologies used to safeguard human health The book concludes by proposing a holistic systems approach such as Integrated Coastal Zone Management to address the interconnected scientific challenges of increased human population pressure pollution over exploitation of food resources and the urgent need for effective public health solutions to be developed from politically and environmentally meaningful policies
