

SIDE EFFECTS OF A **SEDENTARY LIFESTYLE**

DIGESTIVE ISSUES

Sitting down compresses the abdomen and slows down digestion, which can cause constipation – when stools become dry, hard, and difficult to pass.

POOR MENTAL HEALTH

Sitting down for extended periods of time can decrease a person's motivation and make it difficult for them to manage symptoms of anxiety and depression.

POOR CIRCULATION

When you sit a lot, the heart isn't given a chance to pump blood around the body efficiently, which allows waste products to build up and slow cell regeneration.

BONE MASS LOSS

When you sit a lot, you stop loading your skeletal system with stimulus, which makes the bones weak and more prone to fractures.

phenotype stimulus induced proliferation cytokines and antibodies levels Telomere length and telomerase activity also decline in bone marrow derived and peripheral blood cells and have been shown to play a role in immunosenescence More recently the investigation of short non coding RNA molecules microRNAs miRNAs pointed to this system as a possible control of aging related mechanisms Data obtained on these markers for aging individuals could lead to the generation of a marker panel for pathology prediction to indicate interventions and to evaluate the efficacy of interventions Interventions such as nutrition supplements exercise vaccination different dose concentration of antigen adjuvants have been proposed to circumvent age related diseases Considering the heterogeneity in the aging process further investigation is vital before the indication of interventions for aging individuals As the extension of life expectancy is a reality it is a challenge to understand how the aging population copes with the remodelling of the organism and how interventions could provide longevity in good health
