Red Cockaded Woodpecker:

Red-cockaded Woodpecker David L. Kulhavy, Robert Guy Hooper, Ralph Costa, 1995 **Red-cockaded Woodpecker** Ralph Costa, Susan J. Daniels, 2004 Populations of the red cockaded woodpecker *Picoides borealis* have experienced massive declines since European colonization of North America This is due to extensive habitat loss and alteration Logging of old growth pine forests and alteration of the fire regime throughout the historic range of the species were the primary causes of population decline Listing of the red cockaded woodpecker under the Endangered Species Act of 1973 as amended and increased emphasis on management of non game species have resulted in efforts to recover remnant populations of the red cockaded woodpecker in many parts of its historic range Due to extensive research and adaptive management initiatives much is now known about the elements required for both short and long term management of viable populations of red cockaded woodpeckers A short term strategy is crucial because currently available habitat in nearly all populations is poor in 1 or more critical respects Consequently almost all populations require immediate attention in the short term to insure suitable midstory and understory conditions adequate availability of suitable cavities and restoration of demographic viability through improvements in number and distribution of breeding groups Management techniques including artificial cavities cavity entrance restrictors translocation of birds prescribed fire and mechanical and chemical control of woody vegetation are available to achieve these needs In the long term cost effective management of red cockaded woodpecker populations requires a timber management program and prescribed fire regime that will produce and maintain the stand structure characteristic of high quality nesting and foraging habitat so that additional intensive management specific to the woodpeckers is no longer necessary Timber management that achieves this goal and still allows substantial timber harvest is feasible The implementation of a red cockaded woodpecker management strategy as outlined above represents appropriate ecosystem management in the fire maintained pine ecosystems of the southeastern United States and will ultimately benefit a great number of additional species of plants and animals adapted to this ecosystem *The Red-cockaded Woodpecker* Richard Conner, D. Craig Rudolph, Jeffrey R. Walters, 2010-06-28 Though small among its woodpecker relatives the Red cockaded Woodpecker poses a huge dilemma for its human neighbors Uniquely adapted to live in the old growth pine forests of the southeastern United States the Red cockaded Woodpecker has nearly disappeared as the forests have been cleared for agricultural commercial and residential uses over the last two centuries Today it waits at a crossroads Scientific management practices could restore the woodpecker s habitat and population but the imperative to convert old growth forests to other uses remains In this book three of the leading experts on the Red cockaded Woodpecker offer a comprehensive overview of all that is currently known about its biology and natural history and about the ecology of the fire maintained forests it requires for survival As the most visible endangered species in the Southeast and the one whose conservation impacts the largest land area the Red cockaded Woodpecker holds a compelling interest not only for ornithologists but also for wildlife
