Runoff, Infiltration and Subsurface Flow of Water in Arid and Semi-Arid Regions Arie S. Issar,S.D.

Resnick,2013-06-29 Arid and semi arid regions can be defined as environments in which water is the limiting factor for bio systems This means that survival of life in these regions involves a constant struggle to obtain this limited commodity and draw the maximum benefit out of it However despite the difficulties for plants animals and man to live in these regions they are being utilized more and more because of the pressure of world population growth This is expressed in the expansion of agricultural activities in desert lands as well as by the formation and rapid growth of urban and industrial centers These trends result in a growing demand for water on the one hand and the disposal of vast amounts of waste water as well as other types of refuse on the other Meeting the first demand namely supplying water to the agricultural communities and urban centers involves in many instances the over exploitation and misuse of natural water resources The surplus of waste water sometimes highly loaded with toxic compounds is likely to cause irreversible damage to the environment The geoscientists and engineers face a challenge on two conflicting fronts Success on one front namely in answering the full demand for water may lead to an increase in the pollution of the environment by waste water

Selected Water Resources Abstracts ,1991 Agriculture in Semi-Arid Environments A.E. Hall,G.H. Cannell,H.W. Lawton,2012-12-06 The semi arid zones of the world are fragile ecosystems which are being substantially modified by the activities of mankind Increasing human populations have resulted in greater demands on semi arid zones for providing human sustenance and the possibility that this may enhance desertification is a grave concern These zones are harsh habitats for humans The famines that resulted from drought during the late 1960 s and the 1970 s in the African Sahel illustrated the unreliability of present agricultural systems in this zone Large fluctuations in agricultural production have occurred in semi arid zones of Australia North America and the Soviet Union due to periodic droughts even though considerable agricultural technology has been devoted to agricultural development in these zones The challenge to mankind is to manage these different semi arid zones so that productivity is increased and stabilized and environmental deterioration is decreased Irrigation can be used to increase and stabilize agricultural production in semi arid zones as discussed in Volume 5 of this series Arid Zone Irrigation The present volume Agriculture in Semi Arid Environments focuses on dryland farming in semi arid zones and is relevant to the large areas of the world where rainfall is limiting and where water is not available for irrigation This volume is designed to assist agricultural development in these areas and consists of reviews and analyses of available information by scientists working in Africa Australia and at the University of California

Sustainable Horticulture in Semiarid Dry Lands Shrikant Hiwale,2015-03-16 This book discusses ways of increasing production unit area by making full use of the soil and water under the harsh climatic conditions of semiarid areas This leads to improved sustainability increased availability of fresh produce which is vital for human health and higher incomes for small and marginal farmers Arid and semiarid areas account for almost 70 per cent of the total cropped area of India In these areas physical constraints like low and erratic rainfall high temperature high wind velocity low

fertility poor soil structure salinity of soil and ground water all limit reliable crop production In the absence of any type of aggregation the soils are highly erodible lack structure and have a very coarse in texture with low water holding capacity Intensive agricultural practices increasing population pressure climatic changes environmental pollution loss of biodiversity soil erosion salinization and water depletion are all threatening the sustainability of agriculture In view of the mounting demand for food it is vital to link enhanced food production with nutritional security conservation of natural resources increasing farmers incomes employment generation through agricultural diversification Horticulture particularly of fruit trees can play a major role in solving the problem of nutrition as fruits are rich source of vitamins and minerals and have antioxidant properties Fruit trees which are mostly deciduous add leaf litter to the soil and this ultimately helps to improve the condition of the soil In addition fruit trees are known to reduce soil erosion and reduce run off The trees also play a major role in purifying the environment as they are the known carbon sequesters Fruit tree cultivation is a profitable proposition There is no scope to increase the land surface all increase in productivity therefore has to be from the available land This means introducing cropping systems that can meet the basic food fodder and fuel requirement of farming families
