Semiconductors Probed by Ultrafast Laser Spectroscopy Pt II Robert R. Alfano, 2012-12-02 *Semiconductors Probed by Ultrafast Laser Spectroscopy Volume II* discusses the use of ultrafast laser spectroscopy in studying fast physics in semiconductors. It reviews progress on the experimental and theoretical understanding of ultrafast events that occur on a picosecond and nanosecond time scale. This volume discusses electronic relaxation in amorphous semiconductors and the physical mechanisms during and after the interaction of an intense laser pulse with a semiconductor. It also covers the relaxation of carriers in semiconductors, transient optical pulse propagation, and methods of time-resolved spectroscopy. Scientists, engineers, and graduate students will find this book invaluable.

Ultrafast Spectroscopy of Semiconductors and Semiconductor Nanostructures Jagdeep Shah, 2013-11-21 The field of ultrafast spectroscopy of semiconductors and their nanostructures continues to be an active field of research. Exciting new developments have taken place since the first edition of this book was completed in

1995 This revised edition includes a discussion of many of these recent developments in the field This is accomplished by adding a chapter on Recent Developments at the end of the book This approach was selected to provide a discussion of results while they are still relatively recent Results published before the end of May 1998 were considered for inclusion in this book The objective of this revised edition remains the same as before to provide a cohesive discussion of the many diverse contributions of ultrafast spectroscopy to the field of semiconductors Extensive cross references are made to earlier chapters in order to accomplish this goal The chapter on Recent Developments begins with a brief discussion of new lasers new techniques of ultrafast spectroscopy and novel nanostructures This is followed by a section on Coherent Spectroscopy where some of the most interesting recent developments have taken place These include observation of quantum kinetic effects effects that require going beyond the mean field approach of the semiconductor Bloch equations coherent control of populations and current in semiconductors exciton continuum interactions and many diverse aspects of coherent spectroscopy including studies of microcavities Bragg structures quantum dots and quantum wires

Optical Properties of Semiconductors G. Martinez, 2013-06-29 It is widely recognized that an understanding of the optical properties of matter will give a great deal of important information relevant to the fundamental physical properties This is especially true in semiconductor physics for which due to the intrinsic low screening of these materials the optical response is quite rich Their spectra reflect indeed as well electronic as spin or phonon transitions This is also in the semiconductor field that artificial structures have been recently developed showing for the first time specific physical properties related to the low dimensionality of the electronic and vibronic properties with this respect the quantum and fractional quantum Hall effects are among the most well known aspects The associated reduced screening is also a clear manifestation of these aspects and as such favors new optical properties or at least significantly enhances some of them For all these reasons it appeared necessary to try to review in a global way what the optical investigation has brought today about the understanding of the physics of semiconductors This volume collects the papers presented at the NATO Advanced study Institute on Optical Properties of Semiconductors held at the Ettore Majorana Centre Erice Sicily on March 9th to 20th 1992 This school brought together 70 scientists active in research related to optical properties of semiconductors There

were 12 lecturers who provided the main contributions **Ultrafast Physical Processes in Semiconductors** ,2000-10-06

Statistical Foundations of Irreversible Thermodynamics Roberto Luzzi,Aurea R. Vasconcellos,J. Galvao Ramos,2013-04-17 Thermodynamics is considered to be an offshoot of the Industrial Revolution that began in England in the second half of the 18th Century and from there spread to other parts of the world The word thermodynamics is derived from the Greek therme meaning heat and dynamis meaning force As well known the origins of thermodynamics are founded in the early 19th century in the study of the motive power of heat that is the capability of hot bodies to produce mechanical work However there are of course precursors to these ideas Temperature is probably the earliest thermodynamic concept to attain operational status early in the 17th century with Galileo The science of calorimetry beginning in the late 18th century contemporary with the beginning of the Industrial Revolution led to the establishment of the caloric theory of heat 5 Clausius in the second half of the 19th century established Thermodynamics as a clearly defined science The connection of Thermodynamics with Mechanics is first achieved through kinetic theory with the work of D Bernouilli J Herapath Waterston R Clausius c Maxwell and finally L Boltzmann later through Statistical Mechanics whose main purpose is to determine the thermodynamic properties and values of macroscopic observables in terms of the dynamical laws that govern the motion of the constitutive particles of the system It is not easy to establish precisely the dates of the birth of Statistical Mechanics
