March, 1993-09-27 What is a model How do you construct one What are some common models in the social sciences How can models be applied in new situations What makes a model good Focusing on answers to these and related questions this multidisciplinary introduction to model building in the social sciences formulates interesting problems that involve students in creative model building and the process of invention The book describes models of individual choice exchange adaptation and diffusion Throughout student participation in analytical thinking is encouraged Originally published in 1975 by HarperCollins Publishers

Stochastic Processes Toshio Nakagawa, 2011-05-27 Reliability theory is of fundamental importance for engineers and managers involved in the manufacture of high quality products and the design of reliable systems In order to make sense of the theory however and to apply it to real systems an understanding of the basic stochastic processes is indispensable As well as providing readers with useful reliability studies and applications Stochastic Processes also gives a basic treatment of such stochastic processes as the Poisson process the renewal process the Markov chain the Markov process and the Markov renewal process Many examples are cited from reliability models to show the reader how to apply stochastic processes Furthermore Stochastic Processes gives a simple introduction to other stochastic processes such as the cumulative process the Wiener process the Brownian motion and reliability applications Stochastic Processes is suitable for use as a reliability textbook by advanced undergraduate and graduate students It is also of interest to researchers engineers and managers who study or practise reliability and maintenance Biological Growth and Spread W. Jäger, H. Rost, P. Tautu, 2013-03-12 These Proceedings have been assembled from papers presented at the Conference on Models of Biological Growth and Spread held at the German Cancer Research Centre Heidelberg and at the Institute of Applied Mathematics of the University of

Heidelberg July 16 21 1979 The main theme of the conference was the mathematical representation of biological populations with an underlying spatial structure An important feature of such populations is that they and or their individual components may interact with each other Such interactions may be due to external disturbances internal regulatory factors or a combination of both Many biological phenomena and processes including embryogenesis cell growth chemotaxis cell adhesion carcinogenesis and the spread of an epidemic or of an advantageous gene can be studied in this context Thus problems of particular importance in medicine human and veterinary agriculture ecology etc may be taken into consideration and a deeper insight gained by utilizing more realistic mathematical models Since the intrinsic biological mechanisms may differ considerably from each other a great variety of mathematical approaches theories and techniques is required The aims of the conference were i To provide an overview of the most important biological aspects ii To survey and analyse possible stochastic and deterministic approaches iii To encourage new research by bringing together mathematicians interested in problems of a biological nature and scientists actively engaged in developing mathematical models in biology
