**Science of Debugging** Matthew Telles, Yuan Hsieh, 2001-05 Written by two master programmers the book describes the nature of bugs how they slip through testing and the issues various bugs have in common These discussions are supported by case studies of famous and not so famous bugs and industrial academic research and experiments Each chapter concludes with a bug problem and answers to these problems are provided in the last chapter

Cognitive Models and Intelligent Environments for Learning Programming Enrica Lemut, Benedict DuBoulay, Giuliana Dettori, 2013-11-11 At present there is a general consensus on the nature of learning programming but there are different opinions on what forms an effective environment for it It is generally recognized that the development of a mental model is a formidable task for the student and that learning programming is a complex activity that depends heavily on metacognitive skills This book based on a NATO workshop presents both pure cognitive models and experimental learning environments and discusses what characteristics can make a learning model effective especially in relation to the learning environment natural or computerized The papers cover cognitive models related to different aspects of programming classes of learners and types of environment and are organized in three groups theoretical and empirical studies on understanding programming environments for learning programming and learning programming in school environments Comprehension design construction testing debugging and verification are recognized as interdependent skills which require complicated analysis and may develop independently and indifferent orders in novices This book shows that there is unlikely to be a single path from novice to expert and that the structure of the final product the program may not constrain the process by which it comes into being as much as some would advocate
