Semiconductor Plasma Instabilities, Including Gunn-effect and Avalanche Oscillations Hans Hartnagel, 1969

Plasma and Current Instabilities in Semiconductors Juras Pozhela, 2017-05-03 Plasma and Current Instabilities in Semiconductors details the main ideas in the physics of plasma and current instabilities in semiconductors. The title first covers plasma in semiconductors and then proceeds to tackling waves in plasma. Next, the selection details wave instabilities in plasma and drift instabilities. The text also discusses hot electrons along with the instabilities due to inter-valley electron transfer. The next chapters talk about avalanche and recombination instabilities. The last chapter deals with plasma streams. The book will be of great use to student and professional electronics engineers and technicians. [Semiconductor Plasma Instabilities](#)

Hans Hartnagel, 1969 *Handbook on Plasma Instabilities* Ferdinand F. Cap, 2013-09-11 Handbook on Plasma Instabilities Volume 3 is primarily intended to serve as a sourcebook for obtaining quick information and literature references pertaining to a specific topic. Such a handbook has to be formulated in a way that enables understanding of any one section without requiring full understanding of any other section. Volume 1 Chapters 1-13 presents the fundamental concepts of plasma physics with applications and has more the nature of a textbook treating basic plasma physics: confinement, waves, and macroscopic instabilities. Volume 2 Chapters 14-17 covers various aspects of microinstabilities: beam-plasma systems, stabilization methods, and parametric effects. The present volume Chapters 18-22 starts with a discussion on feedback and dynamic stabilization using parametric and other effects. It then treats nonlinear effects and laser-plasma systems. One chapter is devoted to applications and use of instabilities. It concludes with a report on plasma waves and instabilities in cosmic space. N. Balkan, B.K. Ridley, A.J. Vickers, 2012-12-06 Instabilities associated with hot electrons in semiconductors have been investigated from the beginning of transistor physics in the 1940s. The study of NDR and impact ionization in bulk material led to devices like the Gunn diode and the avalanche photo diode. In layered semiconductors, domain formation in HEMTs can lead to excess gate leakage and to excess noise. The studies of hot electron transport parallel to the layers in heterostructures, single and multiple, have shown abundant evidence of electrical instability, and there has been no shortage of suggestions concerning novel NDR mechanisms such as real-space transfer scattering, induced NDR, inter-sub-band transfer, percolation effects, etc. Real-space transfer has been exploited in negative resistance PETs, NERFETs, and in the charge injection transistor CHINT, and in light-emitting logic devices, but far too little is known and understood about other NDR mechanisms with which quantum well material appears to be particularly well endowed for these to be similarly exploited. The aim of this book is therefore to collate what is known and what is not known about NDR instabilities and to identify promising approaches and techniques which will increase our understanding of the origin of these instabilities which have been observed during the last decade of investigations into high-field longitudinal transport in layered semiconductors. The book covers the fundamental properties of

Semiconductors can exhibit electrical instabilities like current runaway threshold switching current filamentation or oscillations when they are driven far from thermodynamic equilibrium This book presents a coherent theoretical description of such cooperative phenomena induced by generation and recombination processes of charge carriers in semiconductors

Quantum Kinetic Theory Michael Bonitz,2015-11-20 This book presents quantum kinetic theory in a comprehensive way The focus is on density operator methods and on non equilibrium Green functions The theory allows to rigorously treat nonequilibrium dynamics in quantum many body systems Of particular interest are ultrafast processes in plasmas condensed matter and trapped atoms that are stimulated by rapidly developing experiments with short pulse lasers and free electron lasers To describe these experiments theoretically the most powerful approach is given by non Markovian quantum kinetic equations that are discussed in detail including computational aspects *Semiconductor plasma instabilities including*

Laude, 2012-12-06 The impact of Materials Science in our environment has probably never been as massive and decisive as it is today In every aspect of our lives progress has never been so dependent on the techniques involved in producing ever more sophisticated materials in ever larger quantities nor so demanding for technologists to imagine novel processes and circumvent difficulties or take up new challenges Every technique is based on a physical process which is put into practice and optimized The better we know that process the better the optimization and more powerful the technique Laser processing of materials is inscribed in that context As soon as powerful coherent light sources were made available it was realized that such intense sources of energy could be used to heat melt and crystallize materials i.e. to promote phase transitions in atomic systems As early as 1964 attempts in that direction were made but received very little if any attention Reasons for this lack of interest were several For one thing laser technology was not fully developed so that the process offered poor reliability and no versatility Also improving the existing techniques was believed to be sufficient to meet the needs of the time and there was no real motivation to explore new ways

Finally and more important the fundamentals of the physics behind the scenes were and continue to be way out of the running stream
