

SENSITIVITY ANALYSIS APPLIED TO REACTIVE SYSTEMS FOR IMPROVING CONTROL PERFORMANCE

José T. Manzi¹ and Heleno Bispo
Catholic University of Pernambuco – Department of Chemistry

Abstract. This paper is devoted to sensitivity analysis for nonlinear multivariable processes, particularly applied to chemical reactive systems. The presence of uncertainties or shift in the system's behavior has been investigated, based on deterministic models and also by direct application of the disturbance or uncertainty in the model. Such an approach describes the behavior of sensitivity, and since a reduction of sensitivity is desired, it can reveal how the minimum of sensitivity can be obtained. If the principal aim is concerned with process control, the results can also provide a strategy for improving performance, using the idea of fictitious smoothing reactors, meaning a partition and scheduling of variables of interest. Such a strategy can be inserted into software for process control, without additional cost or appreciable computational load.

Keywords: modeling, reactive system, sensitivity analysis, nonlinear PI

1- Introduction

Despite there being a new class of advanced controller, the PI or PID controller is still widely used in more than 95% of all control requirements for most industrial control systems. Their well-known qualities such as robustness in a wide range of industrial process with satisfactory performance, the simplicity of their structure and the low cost of implementation and maintenance are the reasons for such a long life. Due to the linear structure of PID, this class of feedback controllers cannot yield satisfactory results for some application in the industrial environment since chemical real-world processes have some degree of nonlinearity. However, to enable a controller such as this to deal with nonlinearity, efforts have been made to overcome the difficulties, using strategies which can include models of the process (Manzi and Odloak, 1998) and consequently to reduce the degrees of freedom of the system (Rivera et al., 1986), or even to implement the process control in such a way as to reduce dynamically sensitivity to disturbance.

Reactive systems have embodied structures of advanced control techniques for solving problems especially those associated with their nonlinearities, but, in practice, in view of the need to have qualified staff and the consequently increase in the cost of production, such control systems are not yet ordinarily used.

It can also be observed in industrial practice that the results obtained with the PID controller applied mainly to neutralization processes can be improved or its performance further justified, as in the case of temperature control, when sensitivity analysis is considered as a tool which can provide a better understanding of how the process responds in the presence of perturbations in the variables. For a neutralization system it is common to use a typical control strategy known as smoothing tanks. However, such a practice may not be reasonable either from the technical or economic point of view, since it can affect the plant configuration or compromise some operational conditions or the sanitary stability of the process. In this case, sensitivity analysis can contribute to improving the control performance, providing valuable insights and alternative control configurations.

For reaction temperature control, sensitivity analysis can reveal that the use of the so-called smoothing reactor is unnecessary. Such a procedure is already ordinarily applied in practice.

A review of the literature shows a widespread interest in stability analysis but relatively little has appeared on sensitivity, especially with regard to nonlinear systems. Skinskey (1973) presented a sensitivity analysis for cyclic variations in the influent *pH*, which does not reflect the fundamental details of the sensitivity. Other

three phases The first involved basically the feedback control rules in a deterministic framework which were applied in macrodynamic models for analyzing stabilization policies The second phase raised the issues of various types of inconsistencies in deterministic optimal control models due to changing information and other aspects of stochasticity Rational expectations models have been extensively used in this plan to resolve some of the inconsistency problems The third phase has recently focused on the various aspects of adaptive control where stochasticity and information adaptivity are introduced in diverse ways e g risk adjustment and risk sensitivity of optimal control recursive updating rules via Kalman filtering and weighted recursive least squares and variable structure control methods in nonlinear framework Problems of efficient econometric estimation of optimal control models have now acquired significant importance This monograph provides an integrated view of control theory methods synthesizing the three phases from feedback control to stochastic control and from stochastic control to adaptive control Aspects of econometric estimation are strongly emphasized here since these are very important in empirical applications in economics

Germany Structural optimization deals with the optimal design of all systems that consist at least partially of solids and are subject to stresses and deformations This integrated discipline plays an increasingly important role in all branches of technology including aerospace structural mechanical civil and chemical engineering as well as energy generation and building technology In fact the design of most man made objects ranging from space ships and long span bridges to tennis rackets and artificial organs can be improved considerably if human intuition is enhanced by means of computer aided systematic decisions In analysing highly complex structural systems in practice discretization is unavoidable because closed form analytical solutions are only available for relatively simple idealized problems To keep discretization errors to a minimum it is desirable to use a relatively large number of elements Modern computer technology enables us to analyse systems with many thousand degrees of freedom In the optimization of structural systems however most currently available methods are restricted to at most a few hundred variables or a few hundred active constraints
