## Book Reviews

The following reviews were selected from those recently published in various IEEE TRANSACTIONS and Group/Society Newsletters. They are reprinted here to make them conveniently available to the many readers who otherwise might not have ready access to them. Each review is followed by an identification of its original source.

**Noncoherent Optical Processing**—G. L. Rogers (New York: Wiley, 1977, \$17.95). Reviewed by J. M. Goodman, Stanford University, Stanford, CA 94305.

Interest in the field of coherent optical data processing underwent a dramatic increase following the invention and commercial availability of lasers. This burst of activity, which still continues at a strong pace, has tended to overshadow and obscure the field of noncoherent optical data processing, i.e., the optical processing of data using light from nonlaser sources. This latter field is now undergoing something of a renaissance sparked in part by modern developments in the technology of light-emitting diodes, charge-coupled detectors, and related devices. For this reason, Roger's book on noncoherent optical processing is a timely one.

The book is relatively short and quite easy to read. The more complicated analyses are deferred to appendices, allowing the reader to concentrate on the physical ideas as they are introduced. The first chapter offers an historical introduction to the subject of noncoherent processing, beginning with a stereoscope invented by Wheatstone in 1838 for comparing two similar pictures. The survey is quite fascinating, although not comprehensive or complete (many important ideas in this field are buried in the patent literature). Chapter 2 deals with the properties of extended luminous sources, and Chapter 3 introduces the concept of redundant information flow through an optical system. Chapter 4 is concerned with the properties of transparent masks, which are the means by which information is introduced into optical data processing systems. Chapter 5 is a particularly interesting discussion of various methods for performing Fourier transforms with noncoherent light. Upon finishing this chapter, one cannot help having an urge to try some of these simple and elegant methods in the laboratory.

The difficulties associated with noncoherent optical data processing stem from the fact that the physical quantities being manipulated, namely light intensities, are constrained to being nonnegative and real, whereas many desired data processing operations require manipulation of bipolar-real or even complex-valued quantities. Chapters 6 through 9 are in one way or another concerned with the consequences of this constraint and ways of overcoming it. The methods discussed include both spatial encoding of data (e.g., zone-plate encoding for imaging X-ray and  $\gamma$ -ray sources) and temporal encoding of data (e.g., the use of ac interferometers for measurement of fringe amplitude and phase). Very practical discussions of means for achieving these encodings are included. The tenth and final chapter deals with applications of noncoherent processing, drawn primarily (but not exclusively) from the work of Rogers himself and his students. Five short appendices conclude the book.

This book should be recognized as a rather personal statement by a man with a long record of ingenious insights and inventions. Rogers was the first to recognize the similarity between a hologram of a point source and a zone plate (*Nature*, vol. 166, p. 237, 1950), thus greatly

simplifying the physical explanation of holography. He was the first to record a radio-frequency hologram (*Nature*, vol. 177, p. 613, 1956), and he introduced some fascinating ideas about the role of partial coherence in insect vision (*New Scientist*, vol. 12, p. 570, 1961, and *Proc. Roy. Soc. B.*, vol. 157, p. 83, 1962). This list could be lengthened considerably if space permitted. Thus the book offers a unique and rewarding opportunity to benefit from the experience and insights of a very creative individual who has unusual measures of physical understanding, inventiveness, and practicality. Anyone seriously interested in optical data processing will benefit from reading this work. For the beginning student, the book should perhaps be complemented with a fine review article recently published (M. A. Monahan, K. Bromley, and R. F. Bocker, *Proc. IEEE*, vol. 65, p. 121, 1977). The two sources together provide an excellent overview of this interesting and important field.

Reprinted from *IEEE Journal of Quantum Electronics*, September 1978.

## BOOK ALERT

The following descriptions of recent books were prepared by the staff of the Engineering Societies Library, 345 East 47th Street, New York, NY 10017. These books are available in the Library for loan or reference use. The prospective buyer should contact the listed publishers or his local technical book store.

**Reflector Antennas**—A. W. Love, Ed. [New York: IEEE PRESS, 1978, clothbound, 440 pp., \$35.95 (IEEE members \$26.95), \$17.95 paperbound (IEEE members only) ISBN—clothbound 0-87942-103-7; paperbound 0-87942-104-5.]

The book is divided into nine parts, the first being introductory in nature and including historically significant papers that are quite general in character. Parts II, III, and V develop the theory of radiation and pattern formation in symmetrical front-fed reflectors. Parts IV, VI, and IX do likewise for Cassegrainian and offset (i.e., unsymmetrical) systems and for spherical mirrors. Aberrations due to feed displacement and to phase errors caused by reflector surface roughness form the subject matter for Parts VII and VIII with the former section branching, appropriately, into multiple-beam formation by means of lateral feed displacement. For the reader who wishes to delve more deeply into any of these topics, copious bibliographies have been provided for each of the parts.

**Microprocessor Systems Handbook**—D. P. Burton and A. L. Dexter (Norwood, MA: Analog Devices, Inc., 1977, bound, 194 pp., \$9.50, ISBN 0-916350-04-4).

The intent of this book is to provide a concise explanation of microprocessor hardware, the interaction of hardware and software, and the interfacing of microprocessors with A/D and D/A converters. Emphasis is on systems aspects rather than detailed circuit design. The first six chapters discuss the operation of a simple microcomputer, memory
