Novel Approaches to Hard Discrete Optimization Panos M. Pardalos, Henry Wolkowicz, During the last decade many novel approaches have been considered for dealing with computationally difficult discrete optimization problems Such approaches include interior point methods semidefinite programming techniques and global optimization More efficient computational algorithms have been developed and larger problem instances of hard discrete problems have been solved This progress is due in part to these novel approaches but also to new computing facilities and massive parallelism This volume contains the papers presented at the workshop on Novel Approaches to Hard Discrete Optimization The articles cover a spectrum of issues regarding computationally hard discrete problems Advances in Convex Analysis and Global Optimization Nicolas Hadjisavvas, Panos M. Pardalos, 2013-12-01 There has been much recent progress in global optimization

algorithms for nonconvex continuous and discrete problems from both a theoretical and a practical perspective Convex analysis plays a fundamental role in the analysis and development of global optimization algorithms This is due essentially to the fact that virtually all nonconvex optimization problems can be described using differences of convex functions and differences of convex sets A conference on Convex Analysis and Global Optimization was held during June 5-9 2000 at Pythagorion Samos Greece The conference was honoring the memory of C Caratheodory 1873-1950 and was endorsed by the Mathematical Programming Society MPS and by the Society for Industrial and Applied Mathematics SIAM Activity Group in Optimization The conference was sponsored by the European Union through the EPEAEK program the Department of Mathematics of the Aegean University and the Center for Applied Optimization of the University of Florida by the General Secretariat of Research and Technology of Greece by the Ministry of Education of Greece and several local Greek government agencies and companies This volume contains a selective collection of refereed papers based on invited and contributing talks presented at this conference The two themes of convexity and global optimization pervade this book The conference provided a forum for researchers working on different aspects of convexity and global optimization to present their recent discoveries and to interact with people working on complementary aspects of mathematical programming

**Tensor Analysis** Liqun Qi, Ziyang Luo, 2017-04-19 Tensors or hypermatrices are multi-arrays with more than two indices In the last decade or so many concepts and results in matrix theory some of which are nontrivial have been extended to tensors and have a wide range of applications for example spectral hypergraph theory higher order Markov chains polynomial optimization magnetic resonance imaging automatic control and quantum entanglement problems The authors provide a comprehensive discussion of this new theory of tensors Tensor Analysis Spectral Theory and Special Tensors is unique in that it is the first book on these three subject areas spectral theory of tensors the theory of special tensors including nonnegative tensors positive semidefinite tensors completely positive tensors and copositive tensors and the spectral hypergraph theory via tensors Mathematical Optimization Theory and Operations Research Panos

*Noniterative Coordination in Multilevel Systems* Todor Stoilov,2012-12-06

Multilevel decision theory arises to resolve the contradiction between increasing requirements towards the process of design synthesis control and management of complex systems and the limitation of the power of technical control computer and other executive devices which have to perform actions and to satisfy requirements in real time This theory rises suggestions how to replace the centralised management of the system by hierarchical co ordination of sub processes All sub processes have lower dimensions which support easier management and decision making But the sub processes are interconnected and they influence each other Multilevel systems theory supports two main methodological tools decomposition and co ordination Both have been developed and implemented in practical applications concerning design control and management of complex systems In general it is always beneficial to find the best or optimal solution in processes of system design control and management The real tendency towards the best optimal decision requires to present all activities in the form of a definition and then the solution of an appropriate optimization problem Every optimization process needs the mathematical definition and solution of a well stated optimization problem These problems belong to two classes static optimization and dynamic optimization Static optimization problems are solved applying methods of mathematical programming conditional and unconditional optimization Dynamic optimization problems are solved by methods of variation calculus Euler Lagrange method maximum principle dynamical programming

Modern Nonconvex Nondifferentiable Optimization Ying Cui,Jong-Shi Pang,2021-12-02

Starting with the fundamentals of classical smooth optimization and building on established convex programming techniques this research monograph presents a foundation and methodology for modern nonconvex nondifferentiable optimization It provides readers with theory methods and applications of nonconvex and nondifferentiable optimization in statistical estimation operations research machine learning and decision making A comprehensive and rigorous treatment of this emergent mathematical topic is urgently

needed in today's complex world of big data and machine learning. This book takes a thorough approach to the subject and includes examples and exercises to enrich the main themes, making it suitable for classroom instruction. *Modern Nonconvex Nondifferentiable Optimization* is intended for applied and computational mathematicians, optimizers, operations researchers, statisticians, computer scientists, engineers, economists, and machine learners. It could be used in advanced courses on optimization, operations research, and nonconvex and nonsmooth optimization.
