Nonlinear Evolution Equations Dynamica:

Advances in Nonlinear Evolution Equations Mohamed Jleli, Bessem Samet, Calogero Vetro, 2025-01-20 This book presents a collection of significant and original contributions that delve into the realm of nonlinear evolution equations and their applications encompassing both theory and practical usage Serving as a dynamic platform for interdisciplinary collaboration it facilitates the exchange of innovative ideas among scientists from diverse fields who share a keen interest in the intricate world of evolution equations The book bridges the gap between theory and practicality offering valuable insights for researchers and enthusiasts alike transcending disciplinary boundaries Evolution equations a subset of partial differential equations serve as mathematical tools to depict the temporal transformation of physical systems from their initial states These equations find widespread utility in modeling various real world phenomena across diverse disciplines Notable examples of nonlinear evolution equations include the heat equation which characterizes the evolution of heat distribution over time the nonlinear Schrödinger equation instrumental in understanding data transmission in fiber optic communication systems the Korteweg de Vries equation illuminating the dynamics of surface water waves and the portrayal of ion acoustic waves in cold plasma

Dynamics of Evolutionary Equations George R. Sell, Yuncheng You, 2013-04-17 The theory and applications of infinite dimensional dynamical systems have attracted the attention of scientists for quite some time Dynamical issues arise in equations that attempt to model phenomena that change with time The infinite dimensional aspects occur when forces that describe the motion depend on spatial variables or on the history of the motion In the case of spatially dependent problems the model equations are generally partial differential equations and problems that depend on the past give rise to differential delay equations Because the nonlinearities occurring in these equations need not be small one needs good dynamical theories to understand the longtime behavior of solutions Our basic objective in writing this book is to prepare an entree for scholars who are beginning their journey into the world of dynamical systems especially in infinite dimensional spaces In order to accomplish this we start with the key concepts of a semiflow and a flow As is well known the basic elements of dynamical systems such as the theory of attractors and other invariant sets have their origins here

Nonlinear Dynamics and Evolution Equations Hermann Brunner, Xiao-Qiang Zhao, Xingfu Zou, 2006 The papers in this volume reflect a broad spectrum of current research activities on the theory and applications of nonlinear dynamics and evolution equations They are based on lectures given during the International Conference on Nonlinear Dynamics and Evolution Equations at Memorial University of Newfoundland St John's NL Canada July 6-10 2004 This volume contains thirteen invited and refereed papers Nine of these are survey papers introducing the reader to and describing the current state of the art in major areas of dynamical systems ordinary functional and partial differential equations and applications of such equations in the mathematical modelling of various biological and physical phenomena These papers are complemented by four research papers that examine particular problems in the theory and applications of dynamical systems Information for

Nonlinear Evolution Equations: Kinetic Approach Niva B Maslova,1993-03-10 The book is devoted to the questions of the long time behavior of solutions for evolution equations connected with kinetic models in statistical physics There is a wide variety of problems where such models are used to obtain reasonable physical as well as numerical results Fluid Mechanics Gas Dynamics Plasma Physics Nuclear Physics Turbulence Theory etc The classical examples provide the nonlinear Boltzmann equation Investigation of the long time behavior of the solutions for the Boltzmann equation gives an approach to the nonlinear fluid dynamic equations From the viewpoint of dynamical systems the fluid dynamic equations arise in the theory as a tool to describe an attractor of the kinetic equation

book discusses the stability observability and controllability of nonlinear systems of PDEs such as Wave Heat Euler Bernoulli beam Petrovsky Kirchhoff equations and more Methods based on the theory of classical weak functions analysis and movements in Sobolev spaces are used to analyze nonlinear systems of evolutionary partial differential equations With the unifying theme of evolutionary dynamic equations both linear and nonlinear in more complex environments with different approaches the book presents a multidisciplinary blend of topics spanning the fields of PDEs applied to various models coming from theoretical physics biology engineering and natural sciences This comprehensive book is prepared for a diverse audience interested in applied mathematics With its broad applicability this book aims to foster interdisciplinary collaboration and facilitate a deeper understanding of complex phenomenon concepts practically in electromagnetic waves the acoustic model for seismic waves waves in blood vessels wind drag on space the linear shallow water equations sound waves in liquids and gases non elastic effects in the string

Multiscale Modeling of Pedestrian Dynamics Emiliano Cristiani, Benedetto Piccoli, Andrea Tosin, 2014-09-12 This book presents mathematical models and numerical simulations of crowd dynamics The core topic is the development of a new multiscale paradigm which bridges the microscopic and macroscopic scales taking the most from each of them for capturing the relevant clues of complexity of crowds The background idea is indeed that most of the complex trends exhibited by crowds are due to an intrinsic interplay between individual and collective behaviors The modeling approach promoted in this book pursues actively this intuition and profits from it for designing general mathematical structures susceptible of application also in fields different from the inspiring original one The book considers also the two most traditional points of view the microscopic one in which pedestrians are tracked individually and the macroscopic one in which pedestrians are assimilated to a continuum Selected existing models are critically analyzed The work is addressed to researchers and graduate students

Complex Wave Dynamics on Thin Films Hen-hong Chang, E.A. Demekhin, 2002-03-14 Wave evolution on a falling film is a classical hydrodynamic instability whose rich wave dynamics have been carefully recorded in the last fifty years Such waves are known to profoundly affect the mass and heat transfer of multi phase industrial units This book describes the collective effort of both authors and their students in constructing a comprehensive theory to describe the complex wave evolution from nearly harmonic waves at the inlet to complex spatio temporal patterns involving solitary waves downstream The mathematical theory represents a significant breakthrough from classical linear stability theories which can only describe the inlet harmonic waves and also extends classical soliton theory for integrable systems to real solitary wave dynamics with dissipation One unique feature of falling film solitary wave dynamics which drives much of the spatio temporal wave evolution is the irreversible coalescence of such localized wave structures It represents the first full description of a hydrodynamic instability from inception to developed chaos This approach should prove useful for other complex hydrodynamic instabilities and would allow industrial engineers to better design their multi phase apparati by exploiting the deciphered wave dynamics This publication gives a

comprehensive review of all experimental records and existing theories and significantly advances state of the art on the subject and are complimented by complex and attractive graphics from computational fluid mechanics
