Nonlinear Difference Equations Theory With Applications To Social Science Models:

Nonlinear Difference Equations H. Sedaghat, 2003-01-31 This book presents a rare mix of the latest mathematical theory and procedures in the area of nonlinear difference equations and discrete dynamical systems together with applications of this theory to models in economics and other social sciences The theoretical results include not only familiar topics on chaos bifurcation stability and instability of cycles and equilibria but also some recently published and some as yet unpublished results on these and related topics e g the theory of semiconjugates In addition to rigorous mathematical analysis the book discusses several social science models and analyzes some of them in substantial detail This book is of potential interest to professionals and graduate students in mathematics and applied mathematics as well as researchers in social sciences with an interest in the latest theoretical results pertaining to discrete deterministic dynamical systems

Nonlinear Difference Equations H. Sedaghat, 2013-03-14 It is generally acknowledged that deterministic formulations of dynamical phenomena in the social sciences need to be treated differently from similar formulations in the natural sciences Social science phenomena typically defy precise measurements or data collection that are comparable in accuracy and detail to those in the natural sciences Consequently a deterministic model is rarely expected to yield a precise description of the actual phenomenon being modelled Nevertheless as may be inferred from a study of the models discussed in this book the qualitative analysis of deterministic models has an important role to play in understanding the fundamental mechanisms behind social science phenomena The reach of such analysis extends far beyond technical clarifications of classical theories that were generally expressed in imprecise literary prose The inherent lack of precise knowledge in the social sciences is a fundamental trait that must be distinguished from uncertainty For instance in mathematically modelling the stock market uncertainty is a prime and indispensable component of a model Indeed in the stock market the rules are specifically designed to make prediction impossible or at least very difficult On the other hand understanding concepts such as the business cycle involves economic and social mechanisms that are very different from the rules of the stock market Here far from seeking unpredictability the intention of the modeller is a scientific one i e

Geometric Theory of Discrete Nonautonomous Dynamical Systems Christian Pötzsche, 2010-08-24 Nonautonomous dynamical systems provide a mathematical framework for temporally changing phenomena where the law of evolution varies in time due to seasonal modulation controlling or even random effects Our goal is to provide an approach to the corresponding geometric theory of nonautonomous discrete dynamical systems in infinite dimensional spaces by virtue of 2 parameter semigroups processes These dynamical systems are generated by implicit difference equations which explicitly depend on time Compactness and dissipativity conditions are provided for such problems in order to have attractors using the natural concept of pullback convergence Concerning a necessary linear theory our hyperbolicity concept is based on exponential dichotomies and splittings This concept is in turn used to construct nonautonomous invariant manifolds so called fiber bundles and deduce

linearization theorems The results are illustrated using temporal and full discretizations of evolutionary differential equations
