## **Nonlinear Dynamics Of A Wheeled Vehicle:**

**Nonlinear Dynamics of a Wheeled Vehicle** Ryszard Andrzejewski, Jan Awrejcewicz, 2005-07-25 On average 60% of the world's people and cargo is transported by vehicle that move on rubber tires over roadways of various construction composition and quality. The number of such vehicles including automobiles and all manner of trucks increases continually with a growing positive impact on accessibility and a growing negative impact on interactions among humans and their relationship to the surrounding environment. This multiplicity of vehicles through their physical impact and their emissions is responsible for among other negative results: waste of energy, pollution through emission of harmful compounds, degradation of road surfaces, crowding of roads leading to waste of time and increase of social stress and decrease in safety and comfort. In particular, the safety of vehicular traffic depends on a man-vehicle-road system that includes both active and passive security controls. In spite of the drawbacks mentioned above, the governments of almost every country in the world not only expect but facilitate improvements in vehicular transport performance in order to increase such parameters as load capacity and driving velocity while decreasing such parameters as costs to passengers, energy resources, investments, fuel consumption, etc. Some of the problems have clear if not always easily attainable solutions.
