Molecular Basis of Polymer Networks Artur Baumgärtner, Claude E. Picot, 1989 The workshop on the Molecular Basis of Polymer Networks held October 5-7 1988 in Jülich FRG continued a series of workshops jointly organized by the Institute Laue Langevin ILL in Grenoble and the Institute of Solid State Physics of the KFA Jülich The aim of this workshop was to provide a platform for discussions between theoreticians and experimentalists interested in the physics of polymer networks in the hope that the two types of discussion would be synergistic As revealed by the title of this workshop the main focus of the lectures was on molecular aspects of the problem The individual parts of these proceedings cover various approaches Following quite general comments from a physicist examining the situation from outside various new theoretical concepts are developed During the last decade the advent of Small Angle Neutron Scattering SANS has allowed the molecular structure of polymer networks to be studied and thus the reliability of the theories to be tested directly at the molecular level Recent advances in this field are presented The use of new techniques such as ^2H NMR or QELS and the refinements of more classical mechanical experimental measurements have provided new information about the relation between the macroscopic behavior and the microscopic structure of polymer networks Some recent results in this area are discussed for both chemically cross linked networks and gels built by specific interchain interactions

Introduction to Polymer Physics Ulrich Eisele, 2012-12-06 Modern polymer materials are designed by applying principles of correlation between chemical structure physical macrostructure and technological properties Fundamentals of polymer physics are explained in this book without excessive use of calculations Four main sections treat relaxation of polymers melting and crystallization the mechanism of deformation in thermoplastics elastomers and multiphase systems and thermodynamics of mixing and swelling of polymers and polymer networks The book presents the theoretical models of polymer physics in a comprehensive style and relates their applicability to real polymer systems in terms of the available experimental observations

Shaul M. Aharoni, 2012-12-06 Polymer science is a technology driven science More often than not technological breakthroughs opened the gates to rapid fundamental and theoretical advances dramatically broadening the understanding of experimental observations and expanding the science itself Some of the breakthroughs involved the creation of new materials Among these one may enumerate the vulcanization of natural rubber the derivatization of cellulose the giant advances right before and during World War II in the preparation and characterization of synthetic elastomers and semi crystalline polymers such as polyesters and polyamides the subsequent creation of aromatic high temperature resistant amorphous and semi crystal line polymers and the more recent development of liquid crystalline polymers mostly with n in chain mesogenicity other breakthroughs involve the development of powerful characterization techniques Among the recent ones the photon correlation spectroscopy owes its success to the advent of laser technology small angle neutron scattering evolved from n clear reactors technology and modern solid state nuclear magnetic resonance spectroscopy exists because of advances in superconductivity The growing need for high modulus high temperature resistant polymers is opening at present a new technology that of more or less rigid networks The use of such networks is rapidly growing in applications where they are used as such or where they serve as matrices for fibers or other load bearing elements The rigid networks are largely aromatic Many of them are prepared from multifunctional wholly or almost wholly aromatic kernels while others contain large amount of stiff difunctional residus leading to the presence of many main chain liquid crystalline segments in the infinite network

Polymer Networks A. Chompff, 2013-06-29 For several decades polymer science has sought to rationalize the mechanical and thermodynamic properties of polymer networks largely within the framework of statistical thermodynamics Much of this effort has been directed toward the rubbery rather than the glassy state It is generally assumed that networks possess an average composition to which average properties may be assigned from such a continuum view a powerful analysis of such properties as modulus swelling birefringence and thermoelasticity has emerged In the years following the rise of polymer characterization the late 40 s and early 50 s many scientists began to study apparent relations between the properties of linear polymer molecules and the networks obtainable therefrom This search was also stimulated by the wide range of applications of polymer networks in commercial elastomers thermosets and coatings Frequently these data were confidently matched with curves obtained from statistically describable models of networks of ghost chains uniformly distributed in space More recently it has become apparent that polymer chains in networks are not as ideal as assumed in the formulation of statistical models and there has been a shift in emphasis towards the less than ideal perturbed and possibly inhomogeneous networks which are more frequently encountered in practice The continuum approach however had to be developed before inhomogeneous systems could be described the present volume therefore contains both views
