Nondestructive Characterization of Materials VIII Robert E.

Green, 2012-12-06 Different physical models for the Snoek type relaxation in ternary systems Fe-C-Mn are analyzed from the viewpoint of a distance of interatomic interaction taken into account. For non-saturated from the viewpoint of overlapping of interatomic interaction in b.c.c. alloys the physically sufficient and optimal for the computer simulation is the short range model which takes into account the interatomic interaction and the average amount of substitutional atoms in the first coordination shell only. For high alloyed b.c.c. systems i.e. with the overlapped interatomic interaction the carbon atom undergoes an interaction of a few substitutional atoms simultaneously. That leads to the appearance of one broadened Snoek peak. Activation energy of such a peak is summed from the elastic and chemical interatomic interactions. Experimental results for alloys with b.c.c. solid solution structure and its computer simulations allow to introduce the new criterion for the high alloy state of monophase steels: the high alloyed state corresponds to the situation when substitutional atoms can not be considered any longer as the isolated atoms. From the viewpoint of mechanical spectroscopy this situation corresponds to the appearance of one broadened IF Snoek type peak instead of two peaks existed for the steels with lower substitutional atom concentration.

Fatigue crack detection on structural steel members by using ultrasound excited thermography = Erkennung von Ermüdungsrissen in Stahlbauteilen durch ultraschallangeregte Thermografie Plum, Robin Marc, 2015-08-27
Ultrasound excitation of structural steel members leads to localised energy dissipation at existent fatigue cracks and thus allows for thermographic flaw detection. Essential effects on the defect selective heating such as flaw size, plate thickness, crack mouth opening or static preload are systematically investigated. Laser vibrometry measurements of the crack edges, theoretical modelling of frictional heating and numerical simulations contribute to the understanding of the involved physics.

Eddy Current Nondestructive Testing George M. Free, 1981 **Rapid and Nondestructive Detection Techniques for Agri-Product Quality** Te Ma, Xi Tian, Qiang Lyu, Lie Deng, 2024-08-13
Agri-product such as grains, fruits and vegetables play a very important role in people's daily life. The agri-product quality directly affects human life and health. Agri-product quality refers to the quality characteristics acceptable to consumers, which mainly includes external factors such as size, shape, color, defect and texture, and internal factors such as physical properties, chemical composition and tissue diseases. Generally speaking, variety, climate, soil, cultivation techniques, diseases and pests are all factors that affect the agri-product quality. Traditional methods for agri-product quality evaluation are time-consuming, complex and expensive. With the continuous development of modern science and technology, rapid and nondestructive detection technologies are applied to

evaluate the quality of agri product These technologies could obtain the optical acoustics and electrical properties of a specific substance and then reveal the appearance and internal quality of the agri product Furthermore the trend today is that consumers have become more exigent for information about the products they purchase which makes the nondestructive detection technology has more important application value in the field of agri product quality evaluation
