Sensitization of Cancer Cells for Chemo/Immuno/Radio-therapy Benjamin Bonavida, 2008-07-31 Cancer chemotherapy can be traced back to the 1940's and since then the world has witnessed the discovery and the important application of several new drugs The successes of

combination chemotherapy suggested that all cancers can be treated provided that the correct combination of drugs at the correct doses and correct intervals are established. However, with time, tumor cells develop mechanisms of resistance to apoptosis and no longer respond to the majority of cytotoxic therapies. Sensitization of Cancer Cells for Chemo Immuno Radio therapy edited by Benjamin Bonavida reviews novel approaches developed to reverse tumor cell resistance to chemo immuno radio therapy and the use of various sensitizing agents in combination with various cytotoxics. Such sensitizing agents target gene products that regulate resistance and therefore identify novel targets for drug development. This book also introduces several of the current approaches that have been developed by established investigators in the field that are aimed at overcoming resistance. This book is the first that compiles studies on tumor cell sensitization and is useful for students, scientists, clinicians, and pharmaceutical companies. Journal of the National Cancer Institute, 2002-05 **Tumor Marker and Carcinogenesis** Manjul Tiwari, 2022-09-01. Cancer may be regarded as a group of diseases characterized by an i abnormal growth of cells, ii ability to invade adjacent tissue and even distant organs, and iii the eventual death of the affected patient if the tumor has progressed beyond that stage when it can be successfully removed. **Radiotherapy and Clinical Radiobiology of Head and Neck Cancer** Loredana G. Marcu, Iuliana Toma-Dasu, Alexandru Dasu, Claes Mercke, 2018-05-15. Common factors that lead to treatment failure in head and neck cancer are the lack of tumour oxygenation, the accelerated division of cancer cells during treatment, and radioresistance. These tumour-related challenges and possible ways to overcome them are covered in this book, authored by three medical physicists and a clinical oncologist who explain how different radiobiological findings have led to the development of various treatment techniques for head and neck cancer. Novel treatment techniques as supported by current scientific evidence are comprehensively explored, as well as the major challenges that arise in the retreatment of patients who have already undergone a form of radiotherapy for primary head and neck cancer. Features: Uses an interdisciplinary approach encompassing clinical aspects of radiotherapy, radiation biology, and medical physics. Applies content by relating all radiobiological characteristics to their respective clinical implications. Explains the radiobiological rationale for all previous and current clinical trials for head and neck cancer. **DeVita, Hellman, and Rosenberg's Cancer** Vincent T. DeVita, Theodore S. Brooks,Murali M. Yallapu,2025-01-13

Cancer is a complex disease that can evade the immune system's natural defenses. However, recent advancements in immunotherapy have revolutionized cancer treatment by using the body's own immune system to fight cancer. Monoclonal antibodies (mAbs) and immune checkpoint inhibitors are two types of immunotherapy that have shown promise in treating various types of cancer. Monoclonal antibodies are laboratory-produced antibodies that are designed to recognize and target specific proteins on the surface of cancer cells. These antibodies can be used alone or in combination with other therapies such as chemotherapy or radiation. Monoclonal antibodies work by binding to cancer cells and blocking their ability to grow and divide or by marking them for destruction by the immune system. For example, trastuzumab (Herceptin) is a monoclonal antibody that targets HER2-positive breast cancer cells and can be used in combination with chemotherapy to improve survival rates.
