## THE BASICS OF A ROCKET ENGINE

There are four main components in a simplified **Liquid-fuel** rocket engine: the **Pumps**, the **Turbine**, the **Combustion Chamber**, and the **Nozzle**. Each of these play a critical role in creating enough thrust to propel humans and payloads into Earth orbit... and beyond.

"With no air in space, liquid-fueled rockets need to carry both oxidizer (usually oxygen) and fuel (usually hydrogen or kerosene) in specialized tanks. Liquid Hydrogen is the most powerful rocket fuel. The objective of rocket design is to keep the hardware weight as low as possible. Using Liquid Hydrogen allows for a smaller (and lighter) engine.

- ## 7 PUMP IT UP

To reduce the total (wet) weight of the tanks the fuel and oxygen propellants are liquefied through extreme cooling. The Pumps elevate the pressure of these low propellants before sending them on down the line.

- ## 2 COOL PUT

Because of the high temperatures created from burning propellants within the engine, the super-heated fuel is pumped through special passages to keep the **Combustion Chamber** and **Nozzle** from melting. The nozzle is designed to act as a heat exchanger, keeping the metal components cool while expelling the burnt fuel to drive the turbine.

- 
- McGraw-Hill

After the fuel reaches through the coolant passages, it is cooled into the turbochargers. The pressurized fuel passes over the **Turbo**, causing it to rotate. This provides the power to operate the pumps.

- 
- LIGHT THE FIRE

Once the pellets are fed into the **Cyclotronic Chamber**, they are ignited and heated to form a super heated, high-pressure gas. The pressure created by this process forces the gas through the narrow throat and out the **Nozzle**.

- ## 5 ACTIONS ON ACTIONS

In the gas molecules through the forest and out the flue, it generates thrust that pushes up toward the Combustion Chamber, much like the air we draw from an inflated balloon, thus propelling the rocket upward.
