Hagan and Bruner's Microbiology and Infectious Diseases of Domestic Animals William Arthur Hagan, Dorsey William Bruner, John Francis Timoney, 1988 *The Rhabdoviruses* Robert R. Wagner, 2013-06-29 The viruses of the family Rhabdoviridae have an exceedingly broad host range and are widely distributed throughout the animal and plant kingdoms Animal rhabdoviruses infect and often cause disease in insects fish and mammals including man The prototype rhabdovirus vesicular stomatitis virus VSV has been extensively studied and provides perhaps the best model system for studying

negative strand viruses The popularity of VSV as a model system is to a considerable extent due to its relative simplicity and to its rapid growth generally to high titer in many cell types ranging from yeast to human The nucleocapsids of these viruses also carry transcriptional and replicative functions that are expressed in cell free systems The first RNA dependent RNA polymerase was described in VSV and its G protein provided an early model system for studying the synthesis processing and membrane insertion of mammalian glycoproteins VSV is also highly cytopathogenic and has been studied quite extensively for its capacity to kill cells and to shut off cellular macromolecular synthesis Even earlier VSV was discovered to be highly susceptible to the action of interferons and has served ever since as a means for quantitating the activity of interferons To my way of thinking the spark that ignited the explosion of research in this field was struck at the First International Colloquium on Rhabdoviruses attended by 30 or so participants in Roscoff France in June 1972 **The Natural History of Rabies**

George M. Baer,1975 Bats and Viruses Lin-Fa Wang,Christopher Cowled,2015-09-08 Approximately 75% of emerging infectious diseases are zoonoses and the rate of emergence of zoonotic diseases is on the rise Bats are being increasingly recognised as an important reservoir of zoonotic viruses of different families including SARS coronavirus Nipah virus Hendra virus and Ebola virus Understanding bats role in emerging zoonotic diseases is crucial to this rapidly expanding area of research Bats and Viruses A New Frontier of Emerging Infectious Diseases provides an updated overview of research focusing on bat biology and the role bats play as hosts of many major zoonotic viruses The text covers bat biology immunology and genomics Chapters also delve into the various major bat borne virus families including lyssaviruses paramyxoviruses coronaviruses filoviruses and reoviruses among others Edited by leaders in the field Bats and Viruses A New Frontier of Emerging Infectious Diseases is a timely invaluable reference for bat researchers studying microbiology virology and immunology as well as infectious disease workers and epidemiologists among others Immunology of Human Infection André J. Nahmias,Richard J. O'Reilly,2012-12-06 When we were first approached by the senior editors of this series to edit a book on interactions between the host and infectious agents we accepted this offer as an exciting challenge The only condition readily agreed upon was that such a book should focus on the immunology of infections in humans Our reasons if not biases were severalfold We sensed that the fields of microbiology and immunology which had diverged as each was focusing on its individual search were coming together In agreement with the opinions expressed by Dr Richard Krause in the Introduction we strongly believed that the development of the immune system evolved in response to infectious agents and that the evolution of these agents was influenced in turn by the character of the host's responses An intensive examination of the multitude of primitive or more recently developed host defense mechanisms to determine their relative contribution to man's resistance to a given infectious agent appeared to us to be of crucial basic and practical interest Many immune mechanisms studied in animals were being explored in humans and it appeared timely to focus particularly on what was known about man's resistance to infectious agents correlating this information with lessons learned from relevant

experiments in animal models **New Trends and Developments in Vaccines** A. Voller, C.M. Abraham, 2012-12-06 It was not too long ago that many physicians and biomedical scientists felt that the era of vaccines for protecting mankind against infectious disease was coming to an end During the 1940s and 50s the widespread use of newly developed antibiotics and antimicrobial chemotherapeutic agents suggested a new era in medicine i.e. the control and eventual elimination of all infectious diseases at least those caused by bacteria by chemical means The magic bullet proposed by Paul Ehrlich in the early 1900s seemed to be the method of choice for controlling infection However it is now quite evident that those high expectations were unwarranted Although many acute infections especially those caused by pyogenic cocci have been controlled by antibiotics it is quite evident that infectious diseases even those caused by bacteria still are a major problem Thus the old standby of preventative vaccination is making a strong comeback not only for viral but also for bacterial infections However except for a relatively small number of viral diseases and those bacterial diseases due to toxin elaborated by microorganisms rather than invasion and replication of the microbe per se preventative vaccination still has not fulfilled the expectations of their proponents There has been a recent resurgence of interest concerning all aspects of vaccines not only their preparation and administration but also the nature and mechanism of the host immune response to the constituent microorganisms and their products **Morbidity and Mortality Weekly Report** ,1979 *Bats of the Savannah River Site and Vicinity* ,2003
