and machine learning means that these rapidly advancing technologies are finally coming into widespread use within everyday life. Such rapid development in these areas also brings with it a host of social, political, and legal issues as well as a rise in public concern and academic interest in the ethical challenges these new technologies pose. This volume is a collection of scholarly work from leading figures in the development of both robot ethics and machine ethics; it includes essays of historical significance which have become foundational for research in these two new areas of study as well as important recent articles. The research articles selected focus on the control and governance of computational systems, the exploration of ethical and moral theories using software and robots as laboratories or simulations, inquiry into the necessary requirements for moral agency and the basis and boundaries of rights, and questions of how best to design systems that are both useful and morally sound. Collectively, the articles ask what the practical ethical and legal issues arising from the development of robots will be over the next twenty years and how best to address these future considerations.

The De Gruyter Handbook of Artificial Intelligence, Identity and Technology Studies Anthony Elliott, 2024-07-22. The De Gruyter Handbook of Artificial Intelligence, Identity and Technology Studies examines the relationship of the social sciences to artificial intelligence, surveying the various convergences and divergences between science and technology studies on the one hand and identity transformations on the other. It provides representative coverage of all aspects of the AI revolution from employment to education to military warfare, impacts on public policy and governance, and the future of ethics. How is AI currently transforming social, economic, cultural, and psychological processes? This handbook answers these questions by looking at recent developments in supercomputing, deep learning, and neural networks, including such topics as AI mobile technology, social robotics, big data, and digital research. It focuses especially on mechanisms of identity by defining AI as a new context for self-exploration and social relations and analyzing phenomena such as race, ethnicity, and gender politics in human-machine interfaces.

Artificial Intelligence for Learning Donald Clark, 2020-08-13. Artificial intelligence is creating huge opportunities for workplace learning and employee development. However, it can be difficult for L&D professionals to assess what difference AI can make in their organization and where it is best implemented. *Artificial Intelligence for Learning* is the practical guide L&D practitioners need to understand what AI is and how to use it to improve all aspects of learning in the workplace. It includes specific guidance on how AI can provide content curation and personalization to improve learner engagement, how it can be implemented to improve the efficiency of evaluation, assessment, and reporting, and how chatbots can provide learner support to a global workforce. *Artificial Intelligence for Learning* debunks the myths and cuts through the hype around AI, allowing L&D practitioners to feel confident in their ability to critically assess where artificial intelligence can make a measurable difference and where it is worth investing in. There is also critical discussion of how AI is an aid to learning and development, not a replacement, as well as how it can be used to boost the effectiveness of workplace learning, reduce drop-off rates in online learning, and improve ROI. With real-world
