Calcium and the Secretory Process Ronald

Rubin, 2013-06-29 An enormous amount of research effort has been directed toward elucidating the mechanism by which substances are extruded from cells and reviews have been written and symposia held in order to systematize the plethora of evidence made available. However, the approaches employed to study the secretory process have been so diverse that it is difficult if not impossible for one individual or even a group of individuals to keep abreast of all aspects of the field and to analyze them critically. Thus I undertook the writing of this volume with a great deal of trepidation. In searching for some starting point I naturally considered as my primary focus the role of calcium in the secretory process which has occupied my research interests for the past 13 years. But since so much experimentation has been carried out on this and related topics during the last decade or two I felt it was still necessary to visualize this venture from two alternative approaches: 1 a more general one which would cover the subject of calcium and the secretory process from a broad perspective but of course not in great detail and 2 a more specific one restricting coverage to carefully defined limits but with comprehensive analysis of limited topics. The final course undertaken appears to lie somewhere between these two extremes.

Physiology of Membrane Disorders Thomas E.

Andreoli, Darrell D. Fanestil, Joseph F. Hoffman, Stanley G. Schultz, 2013-11-11 The second edition of *Physiology of Membrane Disorders* represents an extensive revision and a considerable expansion of the first edition. Yet the purpose of the second edition is identical to that of its predecessor: namely to provide a rational analysis of membrane transport processes in individual membranes, cells, tissues, and organs which in turn serves as a frame of reference for rationalizing disorders in which derangements of membrane transport processes play a cardinal role in the clinical expression of disease. As in the first edition, this book is divided into a number of individual but closely related sections. Part V represents a new section where the problem of transport across epithelia is treated in some detail. Finally, Part VI which analyzes clinical derangements has been enlarged appreciably. THE EDITORS xi Preface to the First Edition The purpose of this book is to provide the reader with a rational frame of reference for assessing the pathophysiology of those disorders in which derangements of membrane transport processes are a major factor responsible for the clinical manifestations of disease. In the present context we use the term membrane transport to refer to those molecular processes whose cardinal function, broadly speaking, is processes in a cathodic sense the vectorial transfer of molecules either individually or as ensembles across biological interfaces, the latter including those interfaces which separate different intracellular compartments, the cellular and extracellular compartments, and secreted fluids such as glomerular filtrate and extracellular fluids.

Hemoglobin and Red Cell Structure and Function George Brewer, 2013-03-08 Hemoglobin and the red cell have continued to set a dizzying pace as the objects of research in

the two and one half year interval since the First International Conference on Red Cell Metabolism and Function Most exciting perhaps is a beginning molecular attack on sickle cell disease The story of the inter action of red cell metabolism and oxygen transport has continued to unfold and we can now infer that patients with hypoxia usually utilize red cell metabolic adjustments to improve oxygenation This puts the red cell squarely in the center of medical practice since much of medicine heart pulmonary and blood disease deals with inadequate oxygenation On April 27th through the 29th 1972 crystallographers chemists biochemists physiologists geneticists and physi cians from many medical disciplines met in the Towsley Center for Continuing Medical Education at the University of Michigan Ann Arbor to present new data to review recent developments and to try to piece together additional features of the red cell puzzle The meeting was dedicated to Dr Francis John Worsley Roughton Professor Emeritus of Colloid Science University of Cambridge England in recognition of his numerous excellent contributions to the understanding of hemoglobin and red cell function The program got off to a good start with a paper from M F Perutz Nobel Laureate on the structure of hemoglobin Dr

Cellular Regulation of Secretion and Release P.

Michael Conn,2013-09-24 Cellular Regulation of Secretion and Release is a compilation of papers that deals with the processes in cellular perception of stimuli and the response to them Part I describes the receptor occupancy and regulation of stimulus through the use of video image intensification techniques This part also explains a model for the transmembrane regulation of adenylate cyclase that shows the mechanisms that cells use in sensing and responding to extracellular conditions Part II discusses the early responses of secretory cells including changes in phospholipid metabolism in electrophysiological events and in macromolecular carboxymethylation One paper suggests that protein carboxyl methylase has a role in neurotransmission and secretion whether as a part of the exocytotic process or just a help to regulate the process Part III addresses the role in secretion of the subcellular architecture particularly as regards the role of the cytoskeleton in endocrine function or insulin secretion and cytoskeletal proteins Part IV discusses the synthesis processing and storage of secretory products including the role of signal peptides their properties and interactions Part V addresses the mechanisms and modulation of secretion and release in a study of Leydig cells One paper concludes that the regulation of release through dopamine and TRH factors can have more than one mechanism of action This book can be useful for cellular microbiologists bacteriologists endocrinologists researchers and academicians in the biochemistry and in reproductive medicine

Der, Alan Hall, 2005-12-13 Rab GTPases now comprise a family of 63 members They are emerging as the key hub element controlling the membrane architecture of eukaryotic cells They are intimately involved in vesicle targeting and fusion in both the endocytic and exocytic pathways and direct the assembly and disassembly of protein complexes that include regulators GEFs and GAPs effectors tethers motors and fusion components SNAREs that control membrane targeting and fusion During the last 3 years the field has virtually exploded with the identification and characterization of many new Rab proteins and their effectors Our understanding of how Rab GTPases control membrane function remains at its infancy This volume of Methods in Enzymology GTPases Regulating Membrane Targeting and Fusion provides a wealth of new concepts approaches and tools to study Rab proteins in the test tube and in living cells that will be of strong benefit to both established laboratories and new investigators in the field to elucidate Rab GTPase function in cellular development differentiation and proliferation Comprehensive overview of Rab GTPase phylogeny and systems biology Identification and characterization of Rab GEFs GAPs and effectors General methodologies to study Rab GTPase function in vitro and in vivo using biochemical molecular and microscopy approaches

Actions of Prolactin On Molecular Processes James A. Rillema, 2018-01-10 It is well established that the initial interaction of prolactin with its target cells is with specific receptor molecules located on the external surface of the plasma membrane Subsequent to the prolactin receptor interaction however the molecular events that culminate in the regulation of biological processes are not totally understood This book was assembled to review and analyse the currently available information relative to the molecular events involved in the actions of prolactin on cells Hopefully the assimilation of this information will provide the basis for ultimately determining the sequence of molecular reactions by which prolactin expresses its biological responses

Recent Progress in Hormone Research Volume 37 presents the proceedings of the 1980 Laurentian Hormone Conference held in Mont Tremblant Lodge on August 24-29, 1980. The book discusses the role of gonadal steroids in sexual differentiation, the regulation and function of the primate fetal adrenal gland and gonad and an update of congenital adrenal hyperplasia. The text also describes the regulation of the mammalian corpus luteum, the mechanism of calcium action and release of vesicle bound hormones during exocytosis and the properties, intracellular localization and multiple roles of calmodulin in cell regulation. The status of thymosin and other hormones of the thymus gland, the biosynthesis and mechanism of action of the nerve growth factor and immunochemical studies relating to cholecystokinin in the brain and gut are also considered. The book further tackles the mechanism of insulin action, the intracellular receptors and internalization of polypeptide hormones and studies on the structure and function of the chicken progesterone receptor. The text also looks into the role of guanine nucleotides in the regulation of adenylate cyclase activity, the nephrogenous cyclic AMP and the neuroendocrine control of the menstrual cycle. Endocrinologists, physiologists and biochemists will find the book invaluable. Pharmacology John Hadden, 2013-11-09

This comprehensive treatise on the reticuloendothelial system is a project jointly shared by individual members of the Reticuloendothelial RE Society and biomedical scientists in general who are interested in the intricate system of cells and molecular moieties derived from those cells which constitute the RES. It may now be more fashionable in some quarters to consider these cells as part of what is called the mononuclear phagocytic system or the lymphoreticular system. Nevertheless because of historical developments and current interest in the subject by investigators from many diverse areas it seems advantageous to present in one comprehensive treatise current information and knowledge concerning basic aspects of the RES such as morphology, biochemistry, phylogeny and ontogeny, physiology and pharmacology as well as clinical areas including immunopathology, cancer, infectious diseases, allergy and hypersensitivity. It is anticipated that by presenting information concerning these

apparently heterogeneous topics under the unifying umbrella of the RES attention will be focused on the similarities as well as interactions among the cell types constituting the RES from the viewpoint of various disciplines. The treatise editors and their editorial board, consisting predominantly of the editors of individual volumes, are extremely grateful for the enthusiastic cooperation and enormous task undertaken by members of the biomedical community in general and especially by members of the American as well as European and Japanese Reticuloendothelial Societies. Kalloo, Neil Kaplowitz, Chung Owyang, Don W. Powell, 2011-10-13. Over the past twenty years, thousands of physicians have come to depend on Yamada's Textbook of Gastroenterology. Its encyclopaedic discussion of the basic science underlying gastrointestinal and liver diseases, as well as the many diagnostic and therapeutic modalities available to the patients who suffer from them, was and still is beyond compare. This new edition provides the latest information on current and projected uses of major technologies in the field and a new section on diseases of the liver. Biological Chemistry of Organelle Formation T. Bücher, W. Sebald, H. Weiss, 2012-12-06. Eukaryotic cells contain a plurality of organelles distinguished by their specific membranes and contents. Their biogenesis occurs by growth and division of preexisting structures rather than de novo. Mitochondria and chloroplasts, which appear to be descended from prokaryotic ancestors, have retained some DNA and the biosynthetic capability for its expression. They synthesize, however, only a few of their proteins themselves. Most of their proteins are synthesized on free ribosomes in the cytoplasm and are only assembled in the correct membrane after synthesis is complete. The biogenesis of peroxisomes and glyoxysomes also appears to occur by an incorporation of proteins synthesized first in the cytoplasm. Other organelles, the Golgi complex, lysosomes, secretory vesicles, and the plasma membrane, are formed in a different manner. Their proteins are assembled in the membrane of the endoplasmic reticulum during translation by bound ribosomes, and they must then be transported to the correct membrane. The 1980 Mosbach Colloquium was one of the first attempts to discuss the biogenesis of the various organelles in biochemical terms. This was appropriate since the crucial problems now center on the search for signals and receptors that dictate the site of assembly, the route taken, and the final location of a particular organelle protein. The assembly of prokaryotic membranes and the membrane of an animal virus were also discussed since these simpler systems might shed light on the biogenesis of organelles in eukaryotes. *The regulated secretory pathway in neuroendocrine cells* Rafael Vazquez-Martinez, Stéphane Gasman, 2014-08-06. The regulated secretory pathway is a hallmark of neuroendocrine cells. This

process comprises many sequential steps which include ER associated protein synthesis post translational modification of proteins in the Golgi complex sorting and packing of secretory proteins into carrier granules cytoskeleton based granule transport towards the plasma membrane and tethering docking and fusion of granules with specialized releasing zones Each stage is subjected to a rigorous regulation by a plethora of factors that function in a spatially and temporarily coordinated fashion Much effort has been devoted to characterize the precise role of the regulatory proteins participating in the different steps of this process and to identify new factors in order to obtain a unifying picture of the secretory pathway In spite of this and given the enormous complexity of the process certain stages are not fully understood yet and many players remain to be identified The aim of this Research Topic is to gather review articles and original research papers on the molecular mechanisms that govern and ensure the correct release of neuropeptides Calcium and Cellular Secretion Ronald P. Rubin, 2012-12-06 Since the publication of my previous monograph in 1974 important progress has been made in the broad area of calcium research particularly as it pertains to secretory phenomena The significant advance in methodology while widening the scope of our knowledge has caused research in this particular area to become more and more specialized It has therefore become increasingly difficult for researchers to consider and evaluate work outside their own areas of specialization and to comprehend the field from a broad perspective While many valuable reviews on the importance of calcium in cellular function are being produced they have not attempted to pull together all of the existing knowledge into a more general narrative This volume brings together experimental data and theories from diverse sources and attempts to synthesize into a broad conceptual framework the massive amount of specialized information that presently exists in the general area of calcium metabolism and the secretory process It is impossible in a book of this length to discuss specific references in detail and still maintain readability so generalizations must be made
