Loss Of Biodiversity:

Loss of Biodiversity David M. Barker, 2011 This title examines one of the world's critical issues human trafficking. Readers will learn the historical background of this issue leading up to its current and future impact on society. Various forms of modern slavery including debt bondage, child labor, prostitutes, sex slaves, and child soldiers are discussed in detail as well as risk factors for trafficking such as poverty, violence, and cultural, traditional, or religious views. Also covered are the physical, psychological, and spiritual impact trafficking survivors experience, laws intended to combat human trafficking, the tier system, and organizations such as the United Nations and UNICEF. Engaging text, informative sidebars, and color photographs present information realistically, leaving readers with a thorough, honest interpretation of human trafficking. Features include a timeline, facts, additional resources, Web sites, a glossary, a bibliography, and an index. *Essential Issues* is a series in the *Essential Library*, an imprint of ABDO Publishing Company.

Loss of Biodiversity Sharon L. Spray, Karen Leah McGlothlin, 2003 *Loss of Biodiversity* introduces readers to the important concepts for understanding the environmental challenges and consequences of the declining diversity of life on the planet. Contributions from scientists and academics in the social sciences and humanities provide readers with an initial tool kit for understanding the concepts central to their disciplinary perspective and the multi-dimensional aspects of the loss of biodiversity. *Loss of Biodiversity* Rachael Hames, 2017-12-15 Biodiversity is the foundation for maintaining the balance between all living things. When species begin dying out, it upsets this delicate balance and can cause ecological tragedies. Earth's rainforests are homes to vast biodiversity. However, the rainforests are also one of Earth's most threatened habitats. There, animals risk losing their homes through pollution and deforestation. The information presented in this book highlights at-risk animal and plant species and discusses ways readers can lessen their carbon footprint. Colorful photographs of animals and habitats transport readers to distant locations where biodiversity takes center stage.

Biodiversity Loss Charles Perrings, 1997-01-28 This volume reports key findings of the Biodiversity Program of the Royal Swedish Academy of Sciences, Beijer Institute. The program brought together a number of eminent ecologists and economists to consider the nature and significance of the biodiversity problem. In encouraging collaborative work between these closely related disciplines, it sought to shed new light on the concept of diversity, the implications of biological diversity for the functioning of ecosystems, the driving forces behind biodiversity loss, and the options for promoting biodiversity conservation. The results of the program are surprising. It is shown that the core of the biodiversity problem is a loss of ecosystem resilience and the insurance it provides against the uncertain environmental effects of economic and population growth. This is as much a local as a global problem, implying that biodiversity conservation offers benefits that are as much local as global. The solutions, as well as the causes of biodiversity loss, lie in incentives to local users.

Biodiversity and Conservation: Causes and consequences of biodiversity loss 2 : pollution, climate change and unsustainable exploitation Richard J. Ladle, 2009 Although biodiversity is a relatively new coinage, scientists

have been studying the subject it describes long before the word's first appearance in the language in the mid 1980s. In 1973 for instance the UK Systematics Association held a symposium on The Changing Flora and Fauna of Britain which concluded that not enough attention was being paid to the conservation of rarities; a conclusion also reached said the symposium at a meeting of the Linnaean Society some forty years earlier. By 1980 the Global 2000 Report to the President published by the US Council on Environmental Quality starkly warned of a diminution of up to one fifth of all species by the turn of the century and there is now a growing consensus that the world faces a biodiversity crisis: a potentially catastrophic global loss of genetic ecosystem and most obviously species diversity. Indeed especially since the UN Convention on Biological Diversity was promulgated in Rio de Janeiro in 1992 conserving biodiversity has become the principal focus of the global conservation movement. Indeed the study of the origins, maintenance and protection of diversity has become perhaps the most vibrant offshoot of ecology and conservation studies. It is increasingly taught and studied in universities and other research institutions around the world. Addressing the need for an authoritative reference work to make sense of this rapidly growing subject and its ever more complex and multidisciplinary corpus of scholarly literature Biodiversity and Conservation is a new title in the Routledge series Critical Concepts in the Environment Edited by Richard Ladle of Oxford University's Centre for the Environment. This new Major Work brings together in five volumes the foundational and the very best cutting edge scholarship to provide a synoptic view of all the key issues and current debates.
